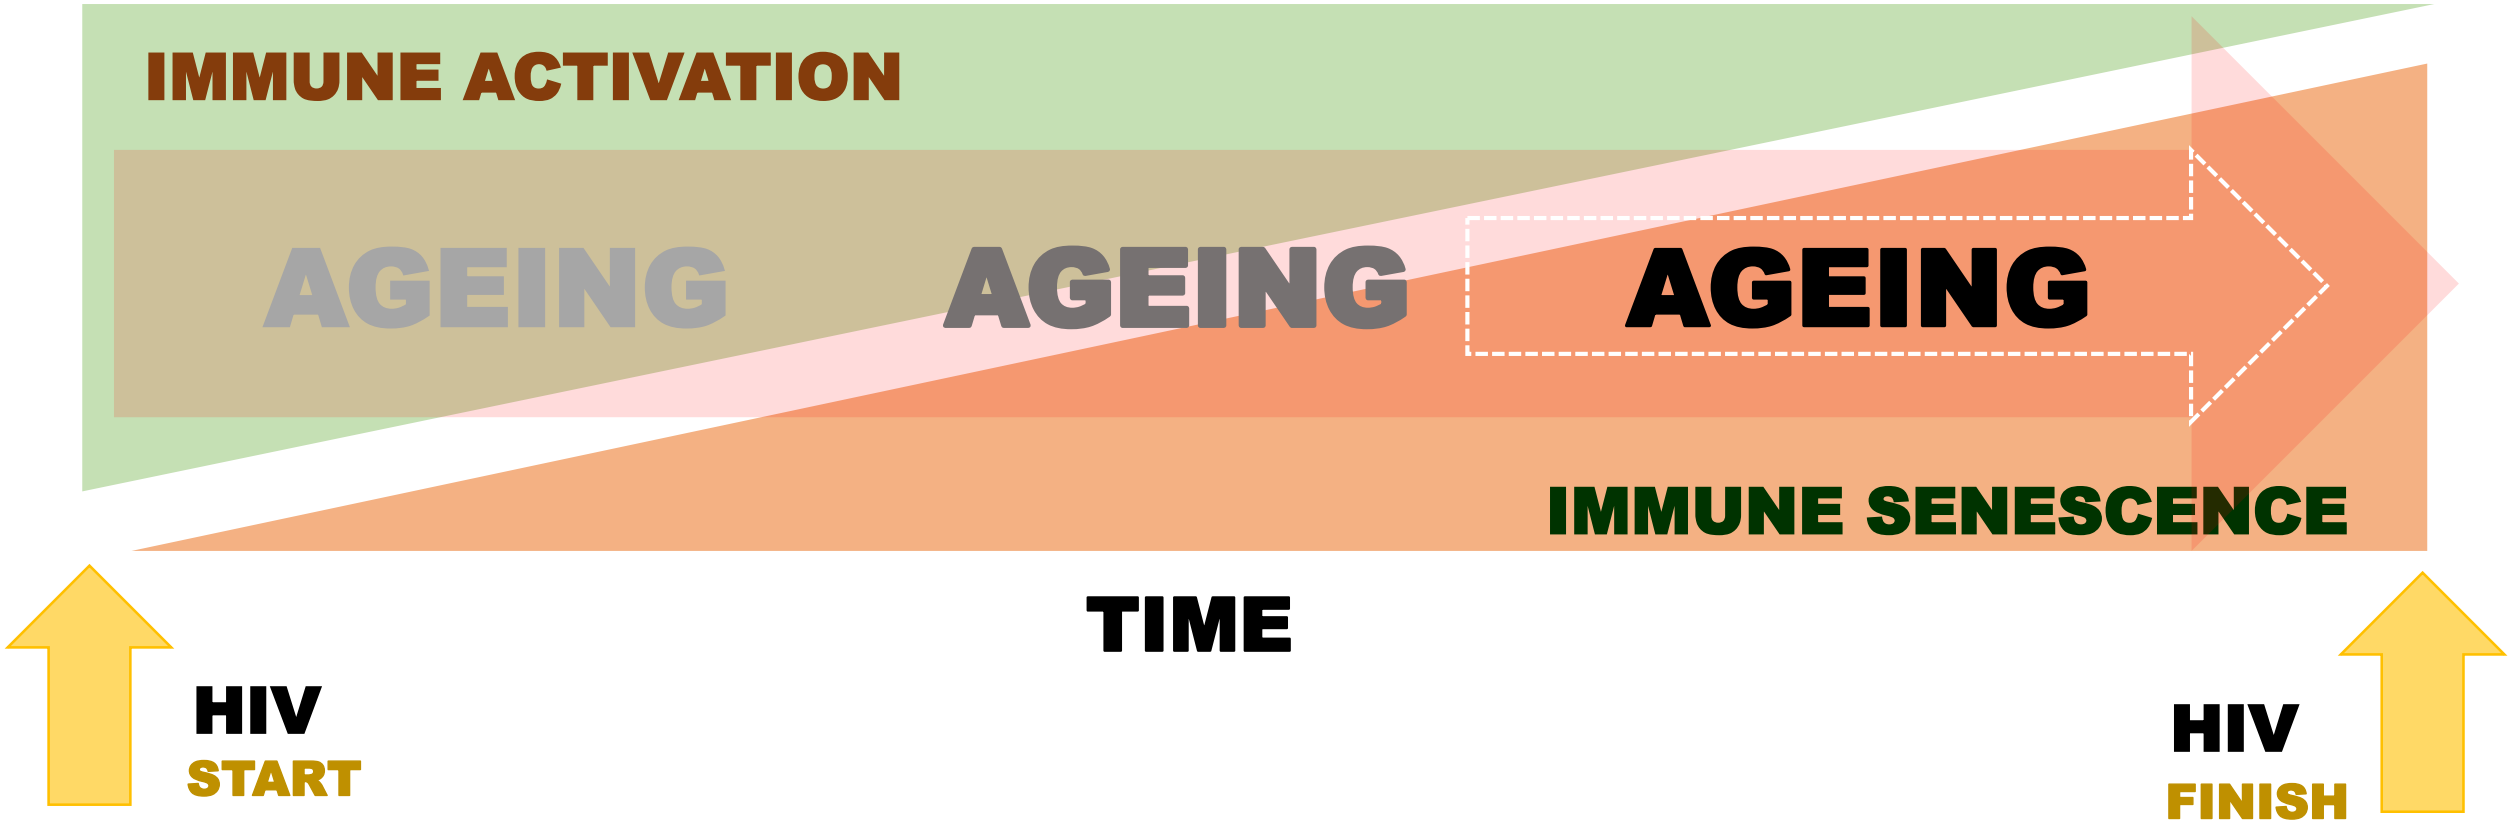
COMORBID DISEASE: HIV and INFLAMMATION

Dr Dave Spencer HIV Clinicians Society Conference October 2018



Sokoya T, Steel HC, Niewoudt M, Rossouw TM. HIV as a Cause of Immune Activation and Immunosenesence. Mediation of Inflammation 2017. Accessed on https://doi.org/10.1155/2017/6825493

Robbins GK, Spritzler JG, et al. Incomplete Reconstitution of T Cell Subsets on Combination Antiretroviral Therapy in the AIDS Clinical Trials Group Protocol 384. *CID* 2009;48:350-61

ACTG 384

Multinational RCT
Comparing:
2NRTI + EFV
vs 2NRTI + NLF

N = 978 total group

n* = 621 with
immune subsets

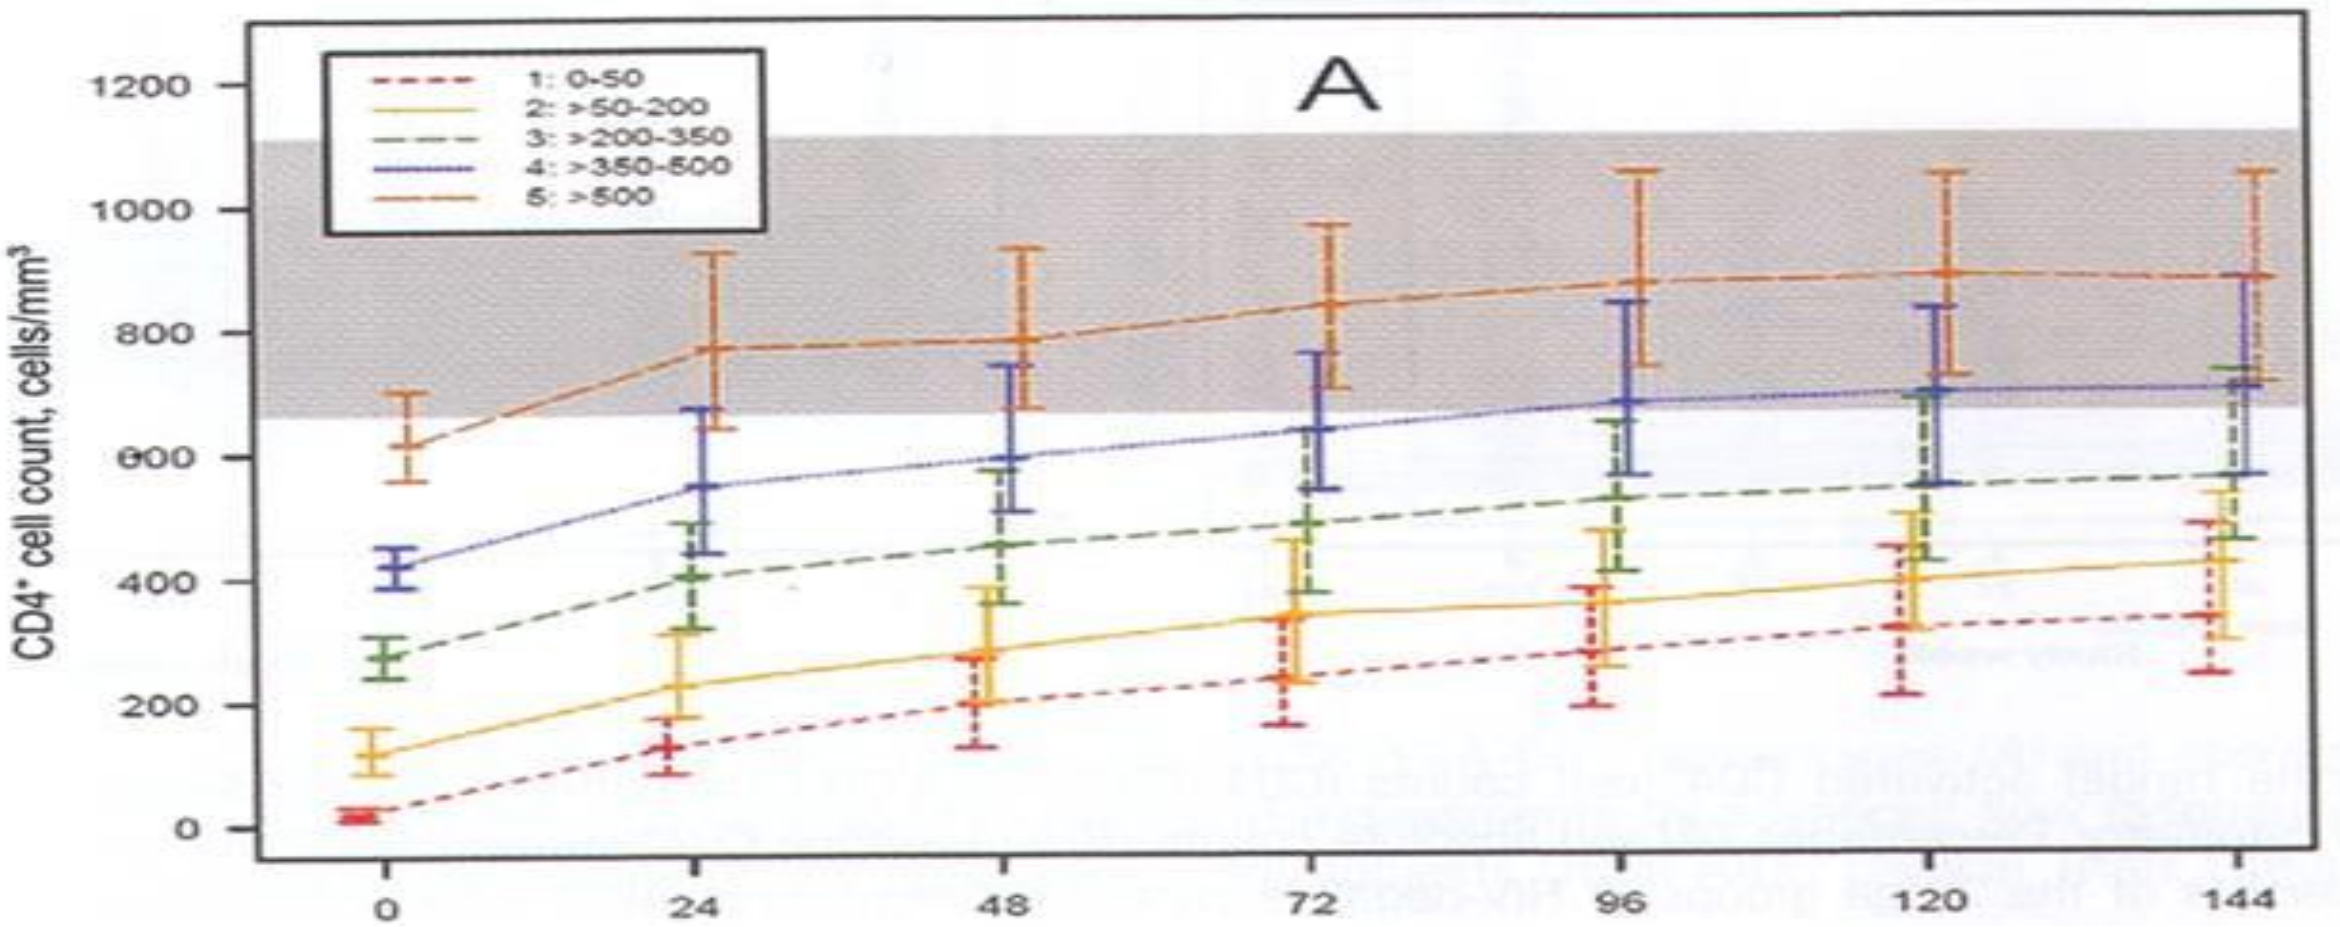
Duration: 3 years

Baseline CD4+ cell strata

CD4 ≤50 c/μL
CD4 51-200 c/μL
CD4 201-350 c/μL
CD4 351-500 c/μL
CD4 >500 c/μL

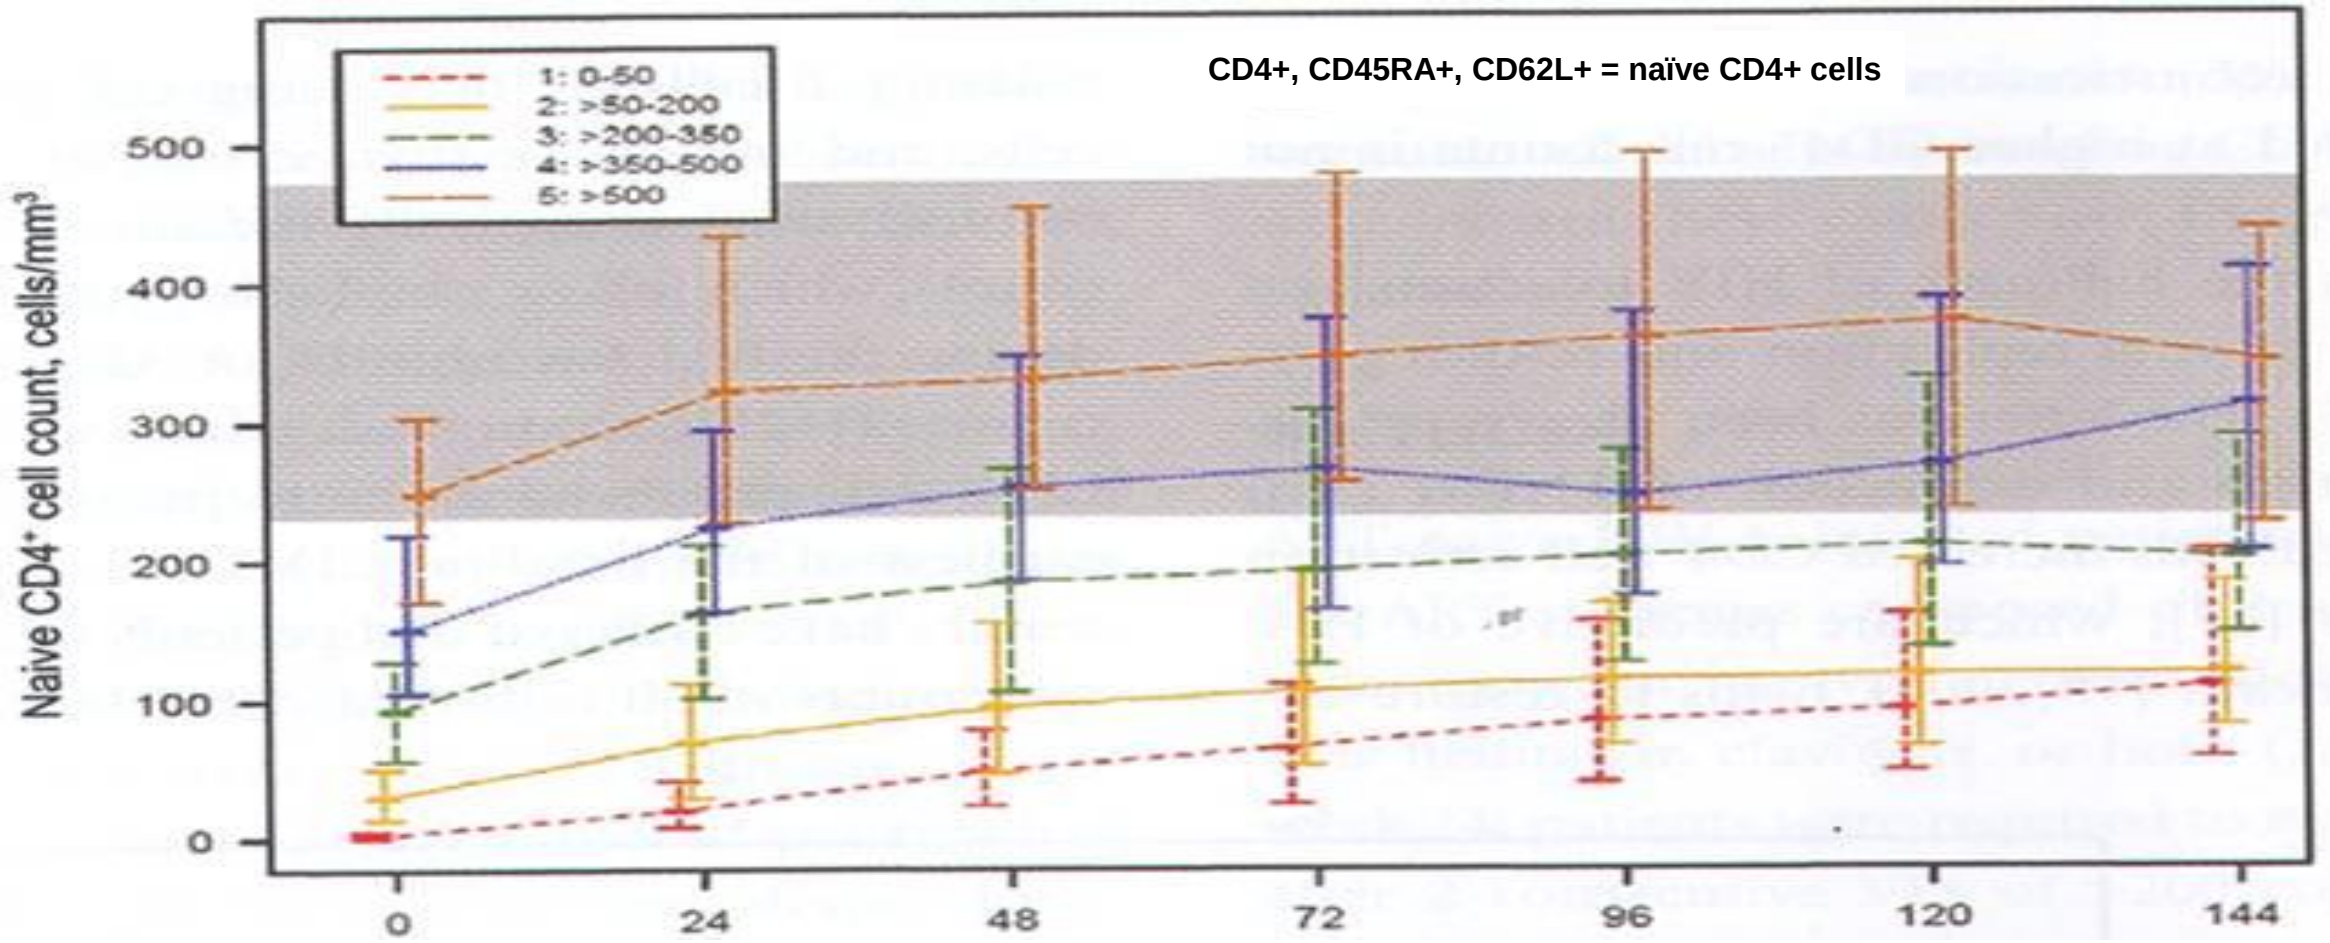
Immune cell subsets defined with flow cytometry

Naive CD4+ cells: CD4+, CD45RA, CD62L+
Memory CD4+ cells: CD4+, CD45RO+
B cells: CD3-, CD19+
Activated CD4+ and CD8+: CD38+, HLA-DR+
NK cells: CD3-, CD56+, CD16+



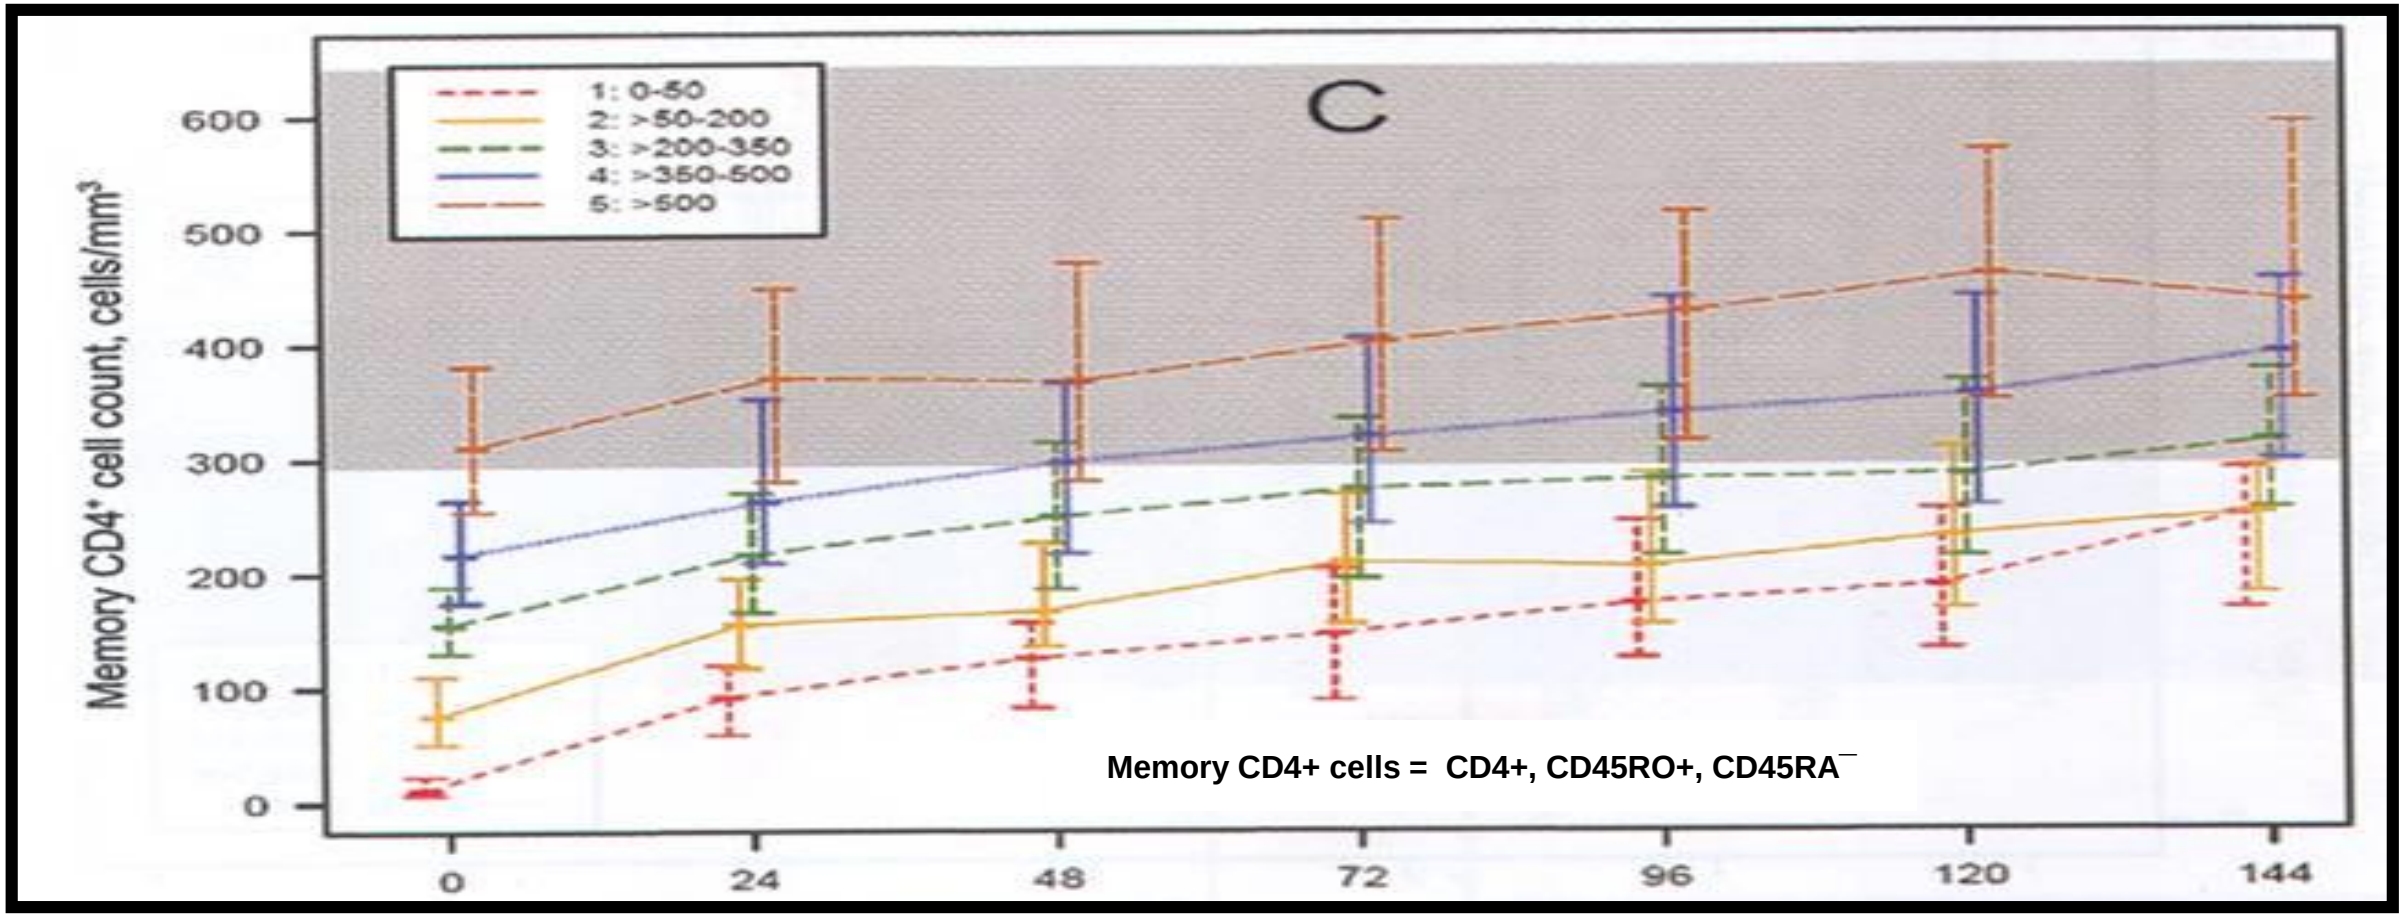
Median CD4+ cell counts by strata from baseline at week 0 to week 144 on HAART. The shaded band represents CD4+ counts in aged matched HIV-ve control subjects.

Robbins GK, Spritzler JG, et al. Incomplete Reconstitution of T Cell Subsets on Combination Antiretroviral Therapy in the AIDS Clinical Trials Group Protocol 384. *CID* 2009;48:350-61



Median naïve CD4+ cell counts by baseline CD4 strata followed from week 0 to week 144. Shaded background reflects the lowest and highest range of HIV-negative control subjects matched by age.

Robbins GK, Spritzler JG, et al. Incomplete Reconstitution of T Cell Subsets on Combination Antiretroviral Therapy in the AIDS Clinical Trials Group Protocol 384. *CID* 2009;48:350-61



Median memory CD4+ cell counts by baseline CD4 count strata from 0 to 144 weeks on HAART. The shaded region represents the upper and lower ranges of HIV-ve control subjects according to age. ACTG Protocols A5113/ ACTG384

Robbins GK, Spritzler JG, et al. Incomplete Reconstitution of T Cell Subsets on Combination Antiretroviral Therapy in the AIDS Clinical Trials Group Protocol 384. *CID* 2009;48:350-61

Robbins GK, Spritzler JG, et al. Incomplete Reconstitution of T Cell Subsets on Combination Antiretroviral Therapy in the AIDS Clinical Trials Group Protocol 384.
CID 2009;48:350-61

RESULTS

Activated CD4+ cells

**Patients in the lower CD4 strata had higher activated CD4+ cell %....
all the way up to stratum level 5 (i.e.>500CD4) up to wk 24**

CD8+ cells, activated CD8+ cells, CD4:CD8 ratios

Except for stratum 1 (<50CD4) CD8+ were abnormally higher than in HIV-ve controls. Activated CD8+% was elevated for all strata at baseline and followed a biphasic decrease but never reached the (low) levels of HIV-ve controls. Improvements in CD4:CD8 ratios were lower in the lower strata and even in the highest strata ratios never matched HIV-ve controls.

Robbins GK, Spritzler JG, et al. Incomplete Reconstitution of T Cell Subsets on Combination Antiretroviral Therapy in the AIDS Clinical Trials Group Protocol 384. *CID* 2009;48:350-61

RESULTS

Natural killer cells

NK cell counts increased slightly in CD4 strata 1-4 but counts for all strata reached 'normal' after baseline analysis

B cells

Baseline B cell counts tended to be lower in the lower strata

Robbins GK, Spritzler JG, et al. Incomplete Reconstitution of T Cell Subsets on Combination Antiretroviral Therapy in the AIDS Clinical Trials Group Protocol 384. *CID* 2009;48:350-61

1

Differences in the CD4+ naïve and memory cell populations in the lowest strata suggest a profound immune deficit in these strata.
Furthermore this deficit may never be fully corrected despite the apparent return of CD4 levels to normal on ART.

2

T-cell activation persisted in all strata of CD4+ groups despite ongoing ART.
This may result from ongoing viral replication (even if low-grade) and bacterial translocation from the GUT.
This activation is possibly associated with higher risks of heart disease and cancer in these patients.

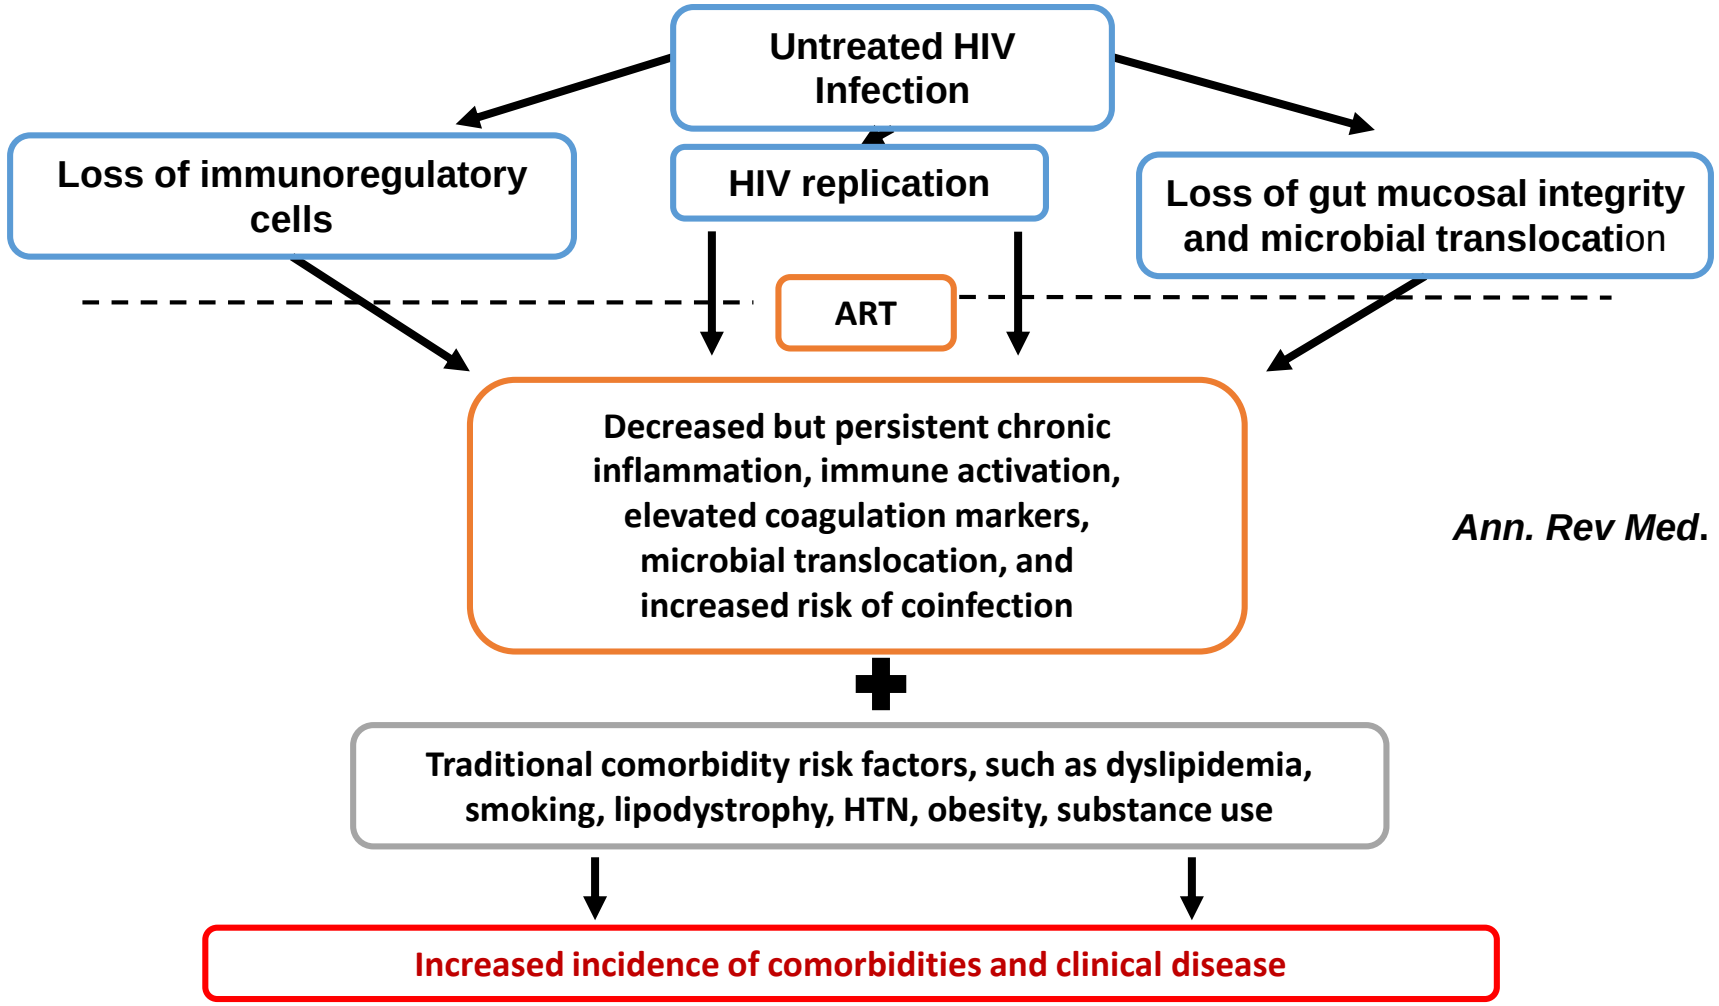
3

Patients initiating ART with baseline CD4+> 350c/μL appeared to achieve T cell subsets more similar to HIV-ve volunteers

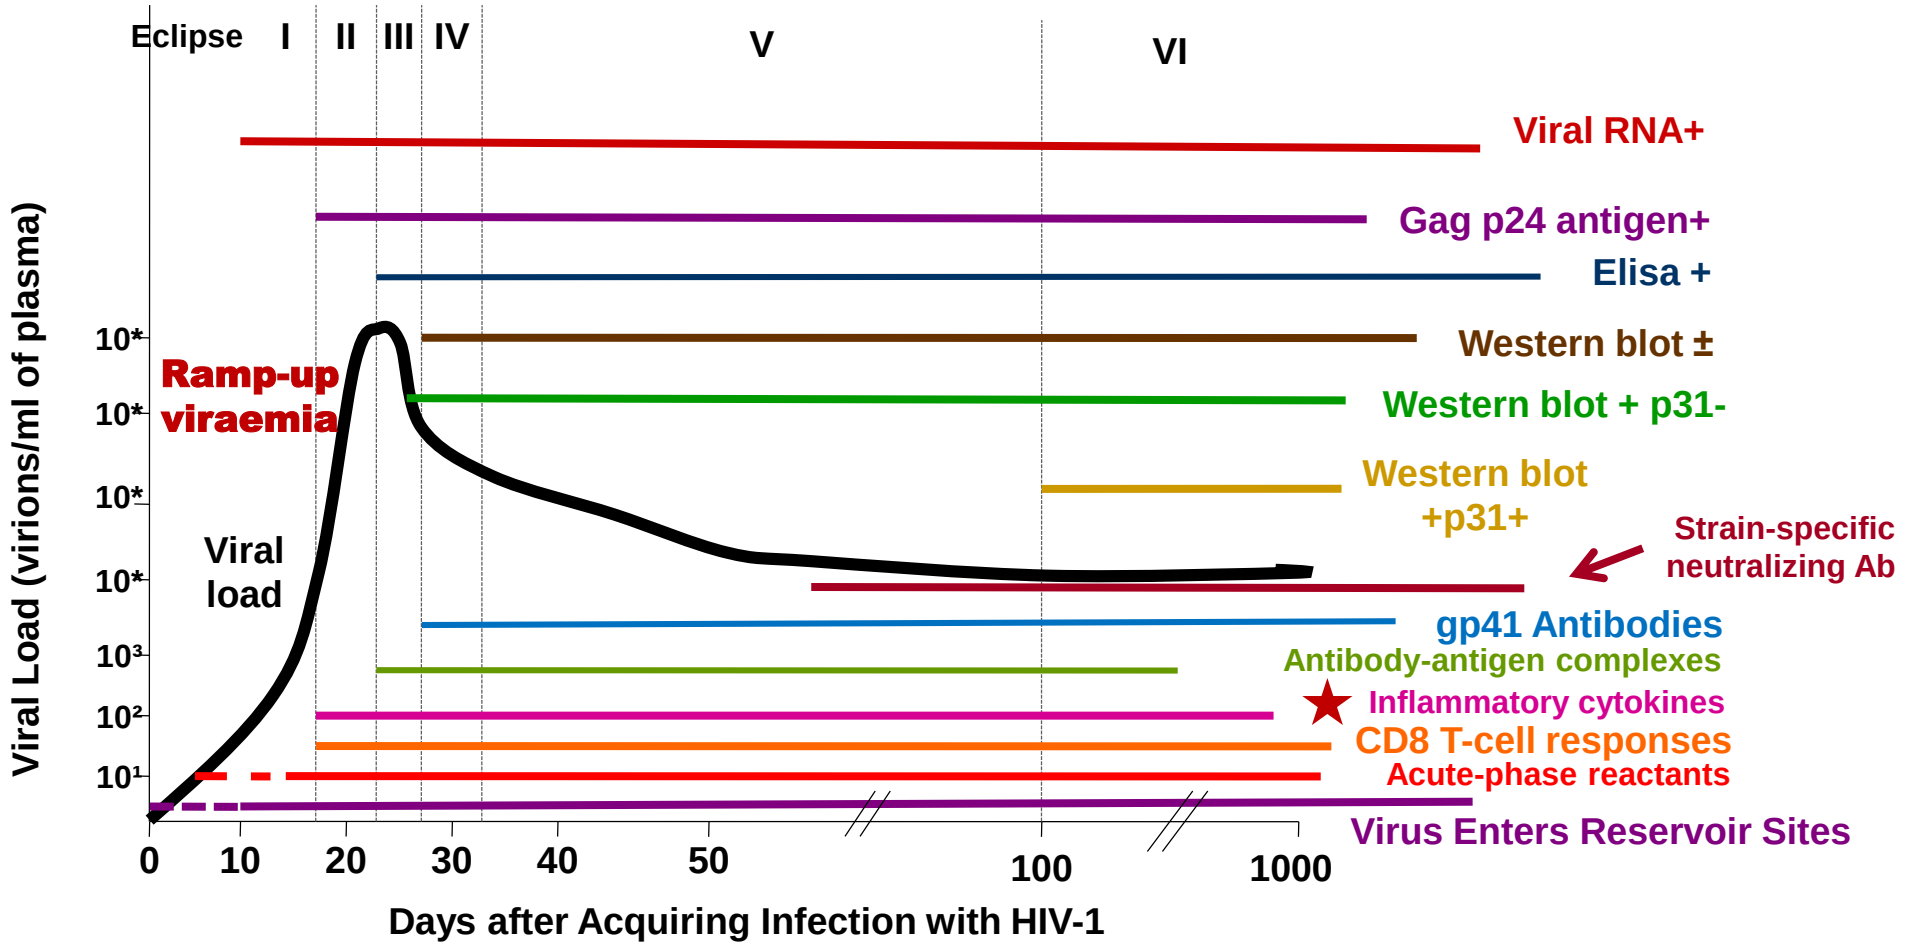
4

Absolute CD4+ cell counts alone are probably NOT an adequate measure of immune reconstitution and may be misleading in the long term.

Chronic Inflammation and Increased Risk for Comorbidities in HIV-Positive Pts



Deeks SG.
Ann. Rev Med. 2011;62:141-155.



★ **A cytokine "storm" contributes to immune activation and CD4 loss and clinical signs and symptoms**

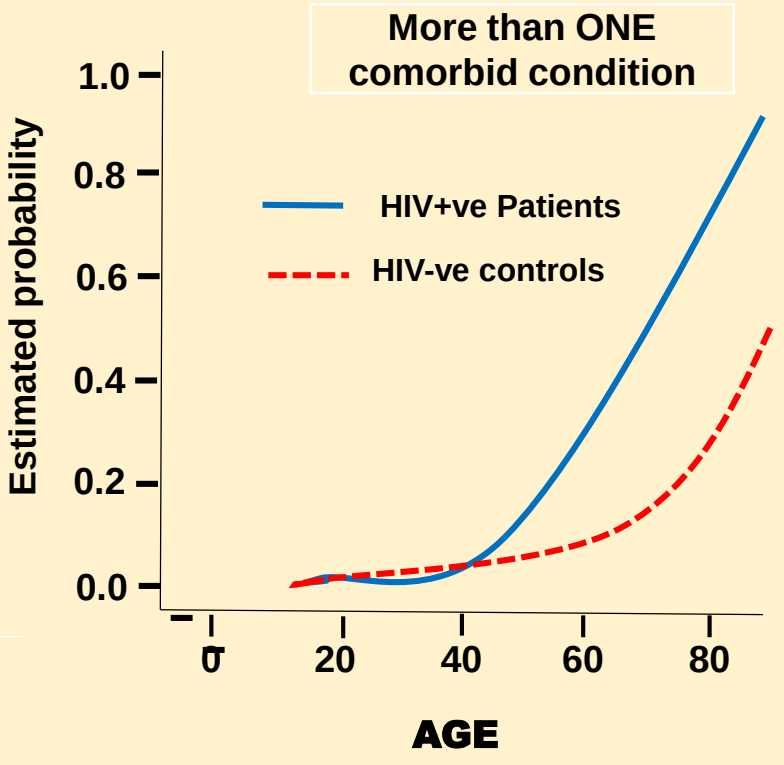
PREMATURE AGEING IN HIV PERSONS



Factors significantly associated with poly-pathology in HIV patients were

Age: per year increase, OR 1.11, 95%CI, 1.10-1.12

Male sex: OR 1.77, 95% CI, 1.44-2.17, P<.001

Nadir CD4 count <200, OR 4.46, 95%CI, 3.73-5.34, P<.001

Exposure to ART, per mth of exposure, OR, 1.01, 95% CI, 1.001-1.019, P=.001

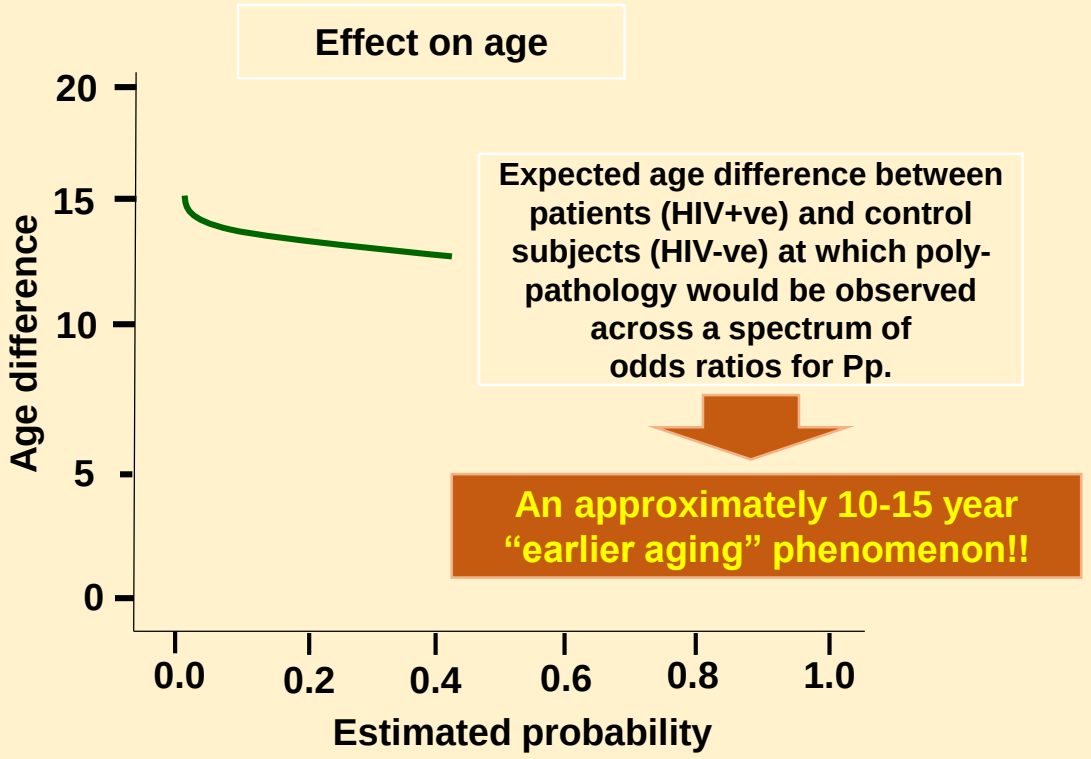


Figure. The risk (probability) of poly-pathology (Pp) by age – as a continuous variable – for HIV+ve patients and uninfected controls in the cohort.

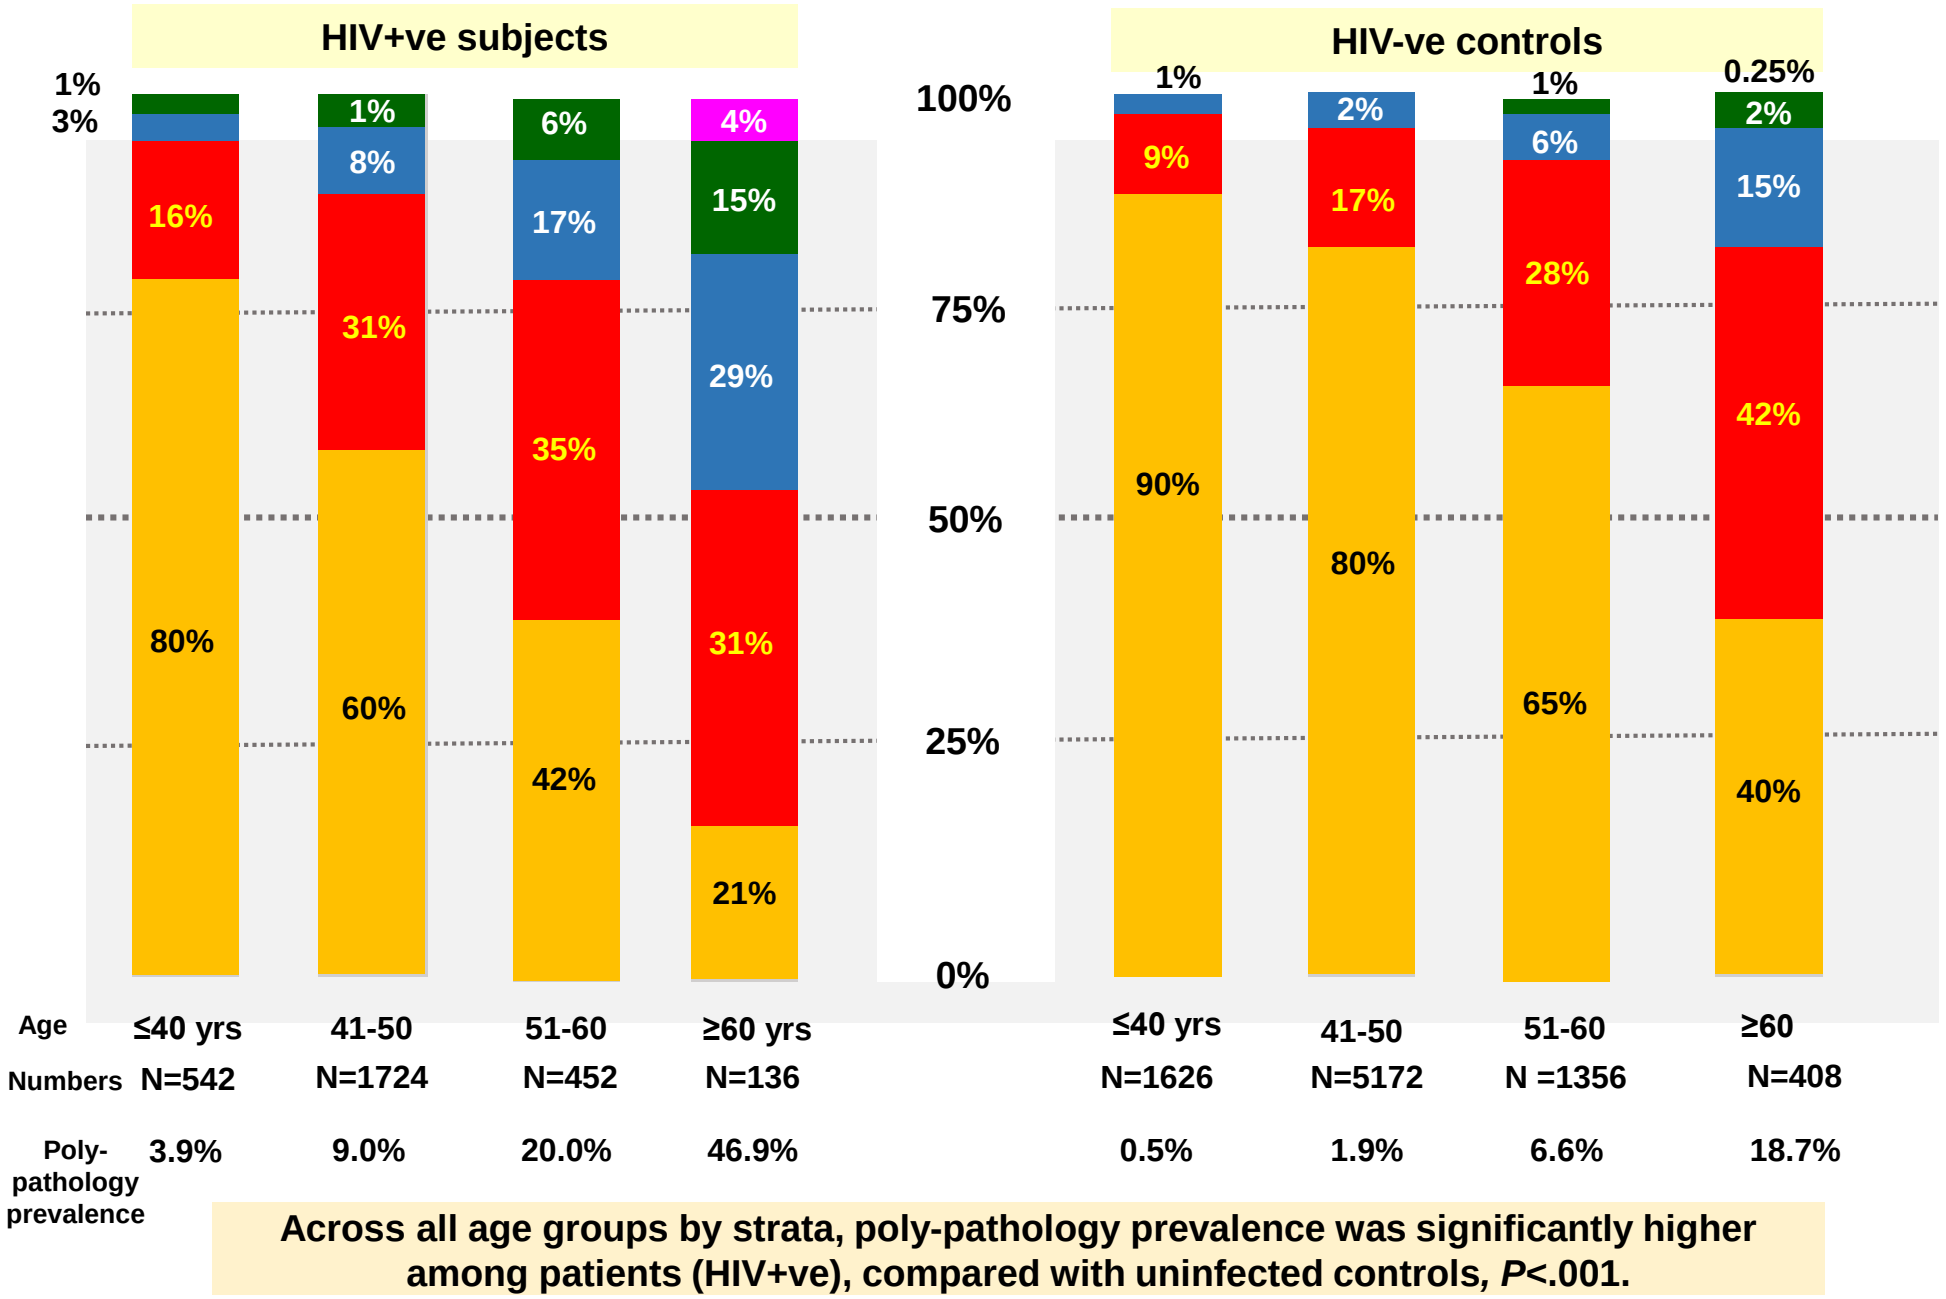
Case-control study n=2854 patients, n=8562 control subjects
Modena University, Italy. 2002-2009. Age = 46yr (Mean)
Conclusion: Specific age-related non-infectious comorbidities and poly-pathologies were more common among HIV+ve group.

Guaraldi G, Orlando G, Zona S, et al. Premature Age-Related Comorbidities Among HIV-Infected Persons Compared With the General Population. *Clin Infect Dis* 2011; 53(11): 1120-6



Across all age groups by strata, poly-pathology prevalence was significantly higher among patients (HIV+ve), compared with uninfected controls, *P*<.001.

Guaraldi G, Orlando G, Zona S, et al. Premature Age-Related Comorbidities Among HIV-Infected Persons Compared With the General Population. *Clin Infect Dis* 2011; 53(11): 1120-6

Legend

- No age-related comorbidity
- One comorbidity
- Two comorbidities
- Three comorbidities
- Four comorbidities

Comorbidities assessed in this Study

- Cardiovascular
- Hypertension
- Renal disease
- Bone fractures
- Diabetes Mellitus Type II

MORBIDITY and MORTALITY AMONG THE HIV-INFECTED: IS IT INFLAMMATORY?

OBJECTIVE: Describe the rate of Grade 4 conditions in a RCT Cohort Study – NOT attributable to AIDS, CVD, non-AIDS cancer and the association of the Grade 4 conditions with IL-6 and D-dimer.

METHODS: N = 3568 HIV+ve participants
VL ≤ 500 cp/mL
Follow-up x 4.3 yr

GRADE 4: any serious condition that requires hospitalisation or is potentially life-threatening: liver, renal, CNS, GIT, Rheumatological, etc.

RESULTS: n =339 subjects w. Grade 4 events: rate 22/1000 person years
N = 165 chronic–inflammatory disease, rate 10.7/1000 person years
These events were more frequent than
AIDS-events (n=54 persons), CVD (n=132), non-AIDS cancer (n=80)
Higher IL-6 and D-dimer levels were associated with a Grade 4 event and with chronic-inflammatory disease (HR = 1.38, p<0.001).

Hart BB, Nordell AD, Okulicz JF, et al. for the INSIGHT SMART and ESPRIT Groups. Inflammation-Related Morbidity and Mortality Among HIV-Positive Adults: How Extensive Is It? *J Acquir Immune Defic Syndr* 2018; 77 (1): 1.7 doi:10.1097/QAI.0000000000001554

By week 2-3 following infection,
the intestinal CD4 cells in the GIT are profoundly depleted although at this time there is no measureable depletion of CD4 cells in lymph nodes or peripheral blood

Centlivre M, Sommer P et al. The HIV-1 clade C promoter is particularly well adapted to replication in the gut in primary infection. *AIDS* 2006;20:657-66

Kotler DP. HIV infection and the gastrointestinal tract. AIDS 2005;19:107-117

The afferent arm of the GIT immune system incorporates specialized surface epithelial tissue including the microfold or M cells.

Below these cells and in close proximity to them, are discrete lymphoid follicles buried in the intestinal sub-mucosa.

This system permits the recognition and trapping of antigen and its subsequent processing.

Whole mount preparation demonstrating a lymphoid follicle in the lamina propria and sub-mucosa of the colon

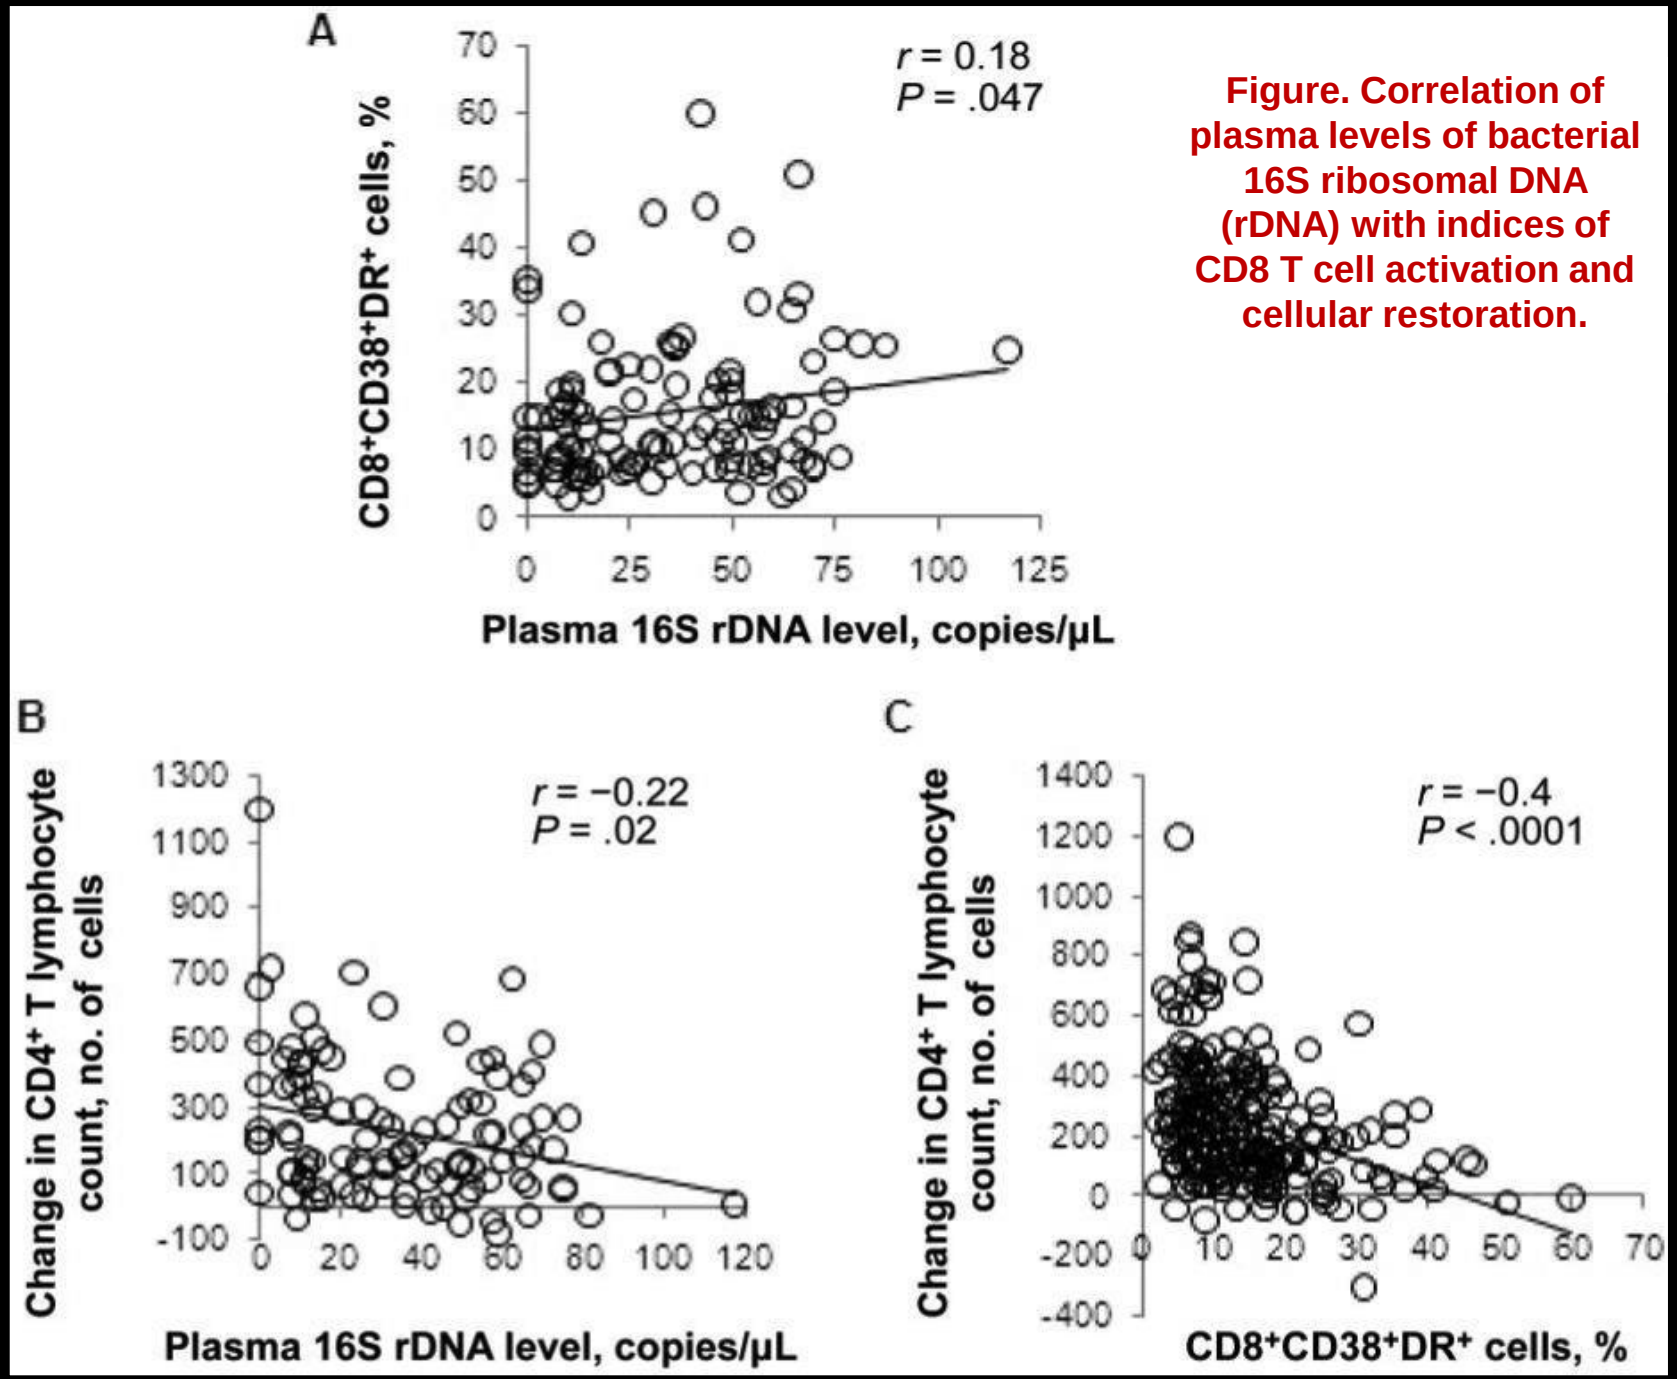


Figure. Correlation of plasma levels of bacterial 16S ribosomal DNA (rDNA) with indices of CD8 T cell activation and cellular restoration.

Jiang W, Lederman MM, et al (JM Brenchley). Plasma Levels of Bacterial DNA Correlate with Immune Activation and the Magnitude of Immune Restoration in Persons with Antiretroviral-Treated HIV Infection. *J Infect Dis* 2009; 199: 1177-1185

A. Plasma 16S rDNA levels correlate directly with the frequency of CD38 and HLA-DR expression on CD8+ T cells.

B. Plasma 16S rDNA levels correlate inversely with the magnitude of CD4+ T lymphocyte restoration after ART.

C. Increases in CD4+ T lymphocyte counts after ART correlate inversely with the proportions of CD8+ T cells expressing CD38 and HLA-DR. *P* values were calculated using Spearman's correlation test.

PREDICTORS OF MORTALITY AND THE SIGNIFICANCE OF GIT BARRIER DYSFUNCTION

Method: Observational Longitudinal Study
[Longitudinal Study of the Ocular Complications of AIDS]
N =64 subjects who died within 12m of ART-mediated viral suppression + matched controls (n =128)

Results:

1 **GIT epithelial-barrier integrity markers** (intestinal fatty acid binding protein + zonulin-1) + soluble CD14, kynurenine/tryptophan ratio, soluble TNF receptor-1, HS-CRP and D-dimer = all increased and predicted mortality (P ≤ 0.001) even after adjustment for baseline CD4 level.

Levels of senescent cells (CD28(-) HLA DR(+), exhausted cells viz. PD1(+), naïve and CMV-specific T cells **did NOT predict mortality**

CD38+ HLA-DR+ CD8 T-cells ('generalised inflammation') did not predict mortality when adjusted for CD4 T cell count.

2 **Interpretation: Not all inflammatory markers carry equal significance with regard to mortality.**

Those related to GIT-integrity appear to be important in this regard.

Hunt PW, Sinclair E, Rodriguez B, et al (Lederman MM). Gut epithelial barrier dysfunction and innate immune activation predict mortality in treated HIV infection. JID 2014 Oct 15; 210(8): 1228-38. doi:10.1093/infdis/jiu238.

SYSTEMIC IMMUNE ACTIVATION / SENESCENCE

1 **HIV ITSELF:**
TAT / NEF
gp120

2 **CONCURRENT INFECTION + INFLAMMATION**

EBV CMV HBV HCV HPV HSV VZV

BACTERIAL PROTOZOAL
FUNGAL HELMINTHS
PERSISTENT/ RECURRENT

3 **LOSS OF GALT and**
ANTIGEN TRANSLOCATION

4 **PROTHROMBOTIC STATE:**
ENDOTHELIAL DYSFUNCTION

5 **THYMIC "COLLAPSE":**
FAILURE OF CELLULAR PROGRAMMING

6 **ACTIVATION OF LOCALLY ACTIVE PROTEINS, ENZYMES, ANTIGENS**
WITH SYSTEMIC AND LOCAL CONSEQUENCES

7 **ACTIVATION OF ALL IMMUNE PARTICIPANTS:**
CELLULAR, HUMORAL, INNATE BARRIERS

TGF-ß1: FIBROSIS

Type I and II IFNs

8 **EVOLUTION OF A CYTOKINE / AND CHEMOKINE MILEAU**

PRO-INFLAMMATORY
[IL-1ß, IL-2, IL-6, IL-8 + TNFα]

VS

ANTI-INFLAMMATORY
[IL-4, IL-10, IL-13]

Sokoya T, Steel HC, Niewoudt M, Rossouw TM. HIV as a Cause of Immune Activation and Immunosenescence. Mediation of Inflammation 2017. Accessed on https://doi.org/10.1155/2017/6825493

CLINICAL EXPRESSION OF IMMUNE ACTIVATION and DYSREGULATION

1

RENAL DISEASE: ATN, HIVAN, AGEING

- Immune cell infiltrate
- Cytokines and chemokines in renal epithelial cells: CCL20, IL-6, IL-8 CHEMOKINES UPREGULATED: CXCL1, CXCL2, CXCL3, CXCL5, CXCL6, CXCL8 (IL-8)

2

COGNITIVE IMPAIRMENT:

- Cytokines in brain and CSF
- CCL20, IL-6, IL-8 CHEMOKINES UPREGULATED: CXCL1, CXCL2, CXCL3, CXCL5, CXCL6, CXCL8 (IL-8)

3

BONE and FRAILTY:

- Accelerated ageing, HIV itself, ARVs
- TNF-α promotes osteoclastic bone resorption via RANKL

4

MALIGNANCY:

- HIV-immune deficiency
- Activation of proto-oncogenes
- Oxidative stress= DNA damage
- Increased IL-17 = abnormal B-cell development and apoptosis

5

CVD and STROKE:

- Vascular wall “stickiness”
- Increase of ICAM and VCAM
- Increase of E and P-selectins
- Lipid-loading of ‘foam cells’ (macrophages) in intimal wall

6

IRIS and BACKGROUND IMMUNE ACTIVATION:

- Cytokine mediated
- Recovery of CD4 cells
- Suppression of HIV
- Early ART: increased mortality

Sokoya T, Steel HC, Niewoudt M, Rossouw TM. 2017. Accessed on https://doi.org/10.1155/2017/6825493

SYSTEMIC IMMUNE ACTIVATION / SENESCENCE

THERAPEUTIC INTERVENTIONS

- **ANTIRETROVIRAL THERAPY (ART)**
- **GIT "REPAIR":** prebiotics and probiotics – no reliable RCT data in HIV. Observational data in animal models.
- **TREAT CO-INFECTION and COMORBID DISEASE:** HBV and HCV
- **CONTROL OF INFLAMMATION:** STEROIDS and METHOTREXATE. Harm from Steroid use in CCM. RCT data for steroid use in PTB, TBM and disseminated TB = some support esp. in HIV-ve cohorts. Methotrexate = risk of harm. Use of steroids in disseminated KS and in KS IRIS = harm.
- **IMMUNE MODULATORS:** no convincing data in HIV+ve populations
  - Statins
  - Selective Cox-2 inhibitors
  - Ceflunomide
  - Rapamycin
  - Mycophenolate
- **SENOLYTICS:** promote apoptosis of senescent cells. In development.

★ **CANAKINUMAB**:
a monoclonal antibody that targets IL-1ß

Ridker PM, Everett BM et al
Antiinflammatory Therapy with Canakinumab for Atherosclerotic Disease.
NEJM 2017 Sept 21; 377; 12: 1119-31

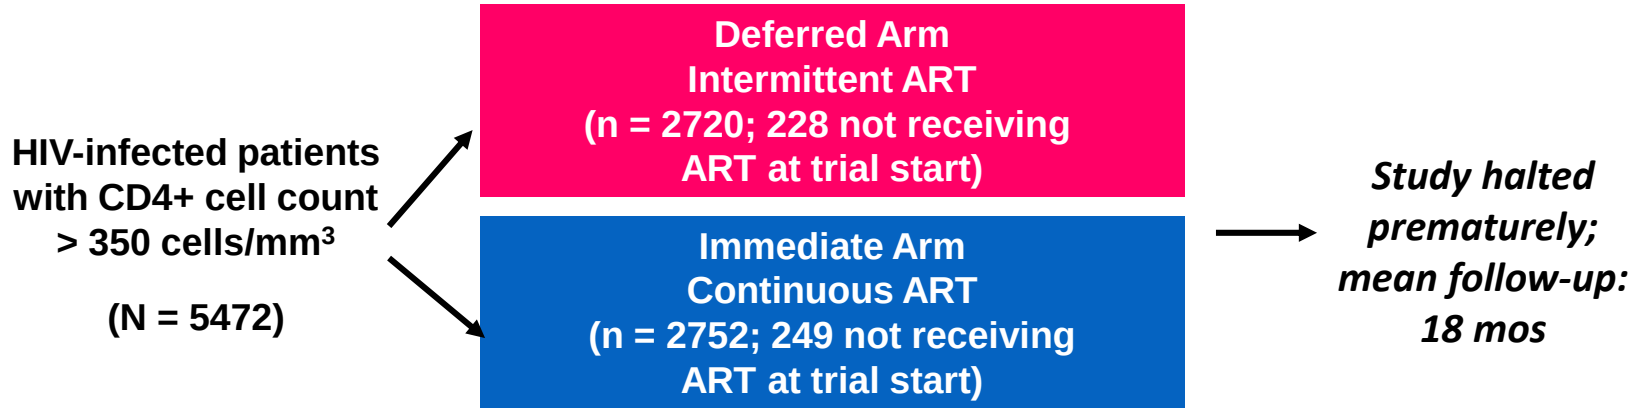
SMART: Subgroup Analysis in Patients Not Receiving ART at Study Entry



- Treatment definitions for subanalysis
  - Deferred: ART initiated when CD4+ cell count < 250 cells/mm³, CD4+ cell percentage < 15%, or HIV symptoms
  - Immediate: ART initiated immediately after randomization
- Primary endpoints
  - OD or death from any cause
  - Fatal or nonfatal OD
  - Serious non-AIDS events
  - Fatal and nonfatal OD plus serious non-AIDS events

Emery S, et al. J Infect Dis. 2008;197:1133-1144.

SMART: Immediate ART Reduces Risk of Clinical Events

- Immediate group experienced substantially fewer events (opportunistic disease or serious non-AIDS events)
  - Excess risk associated with deferring therapy: 5.4 events/100 person-yrs

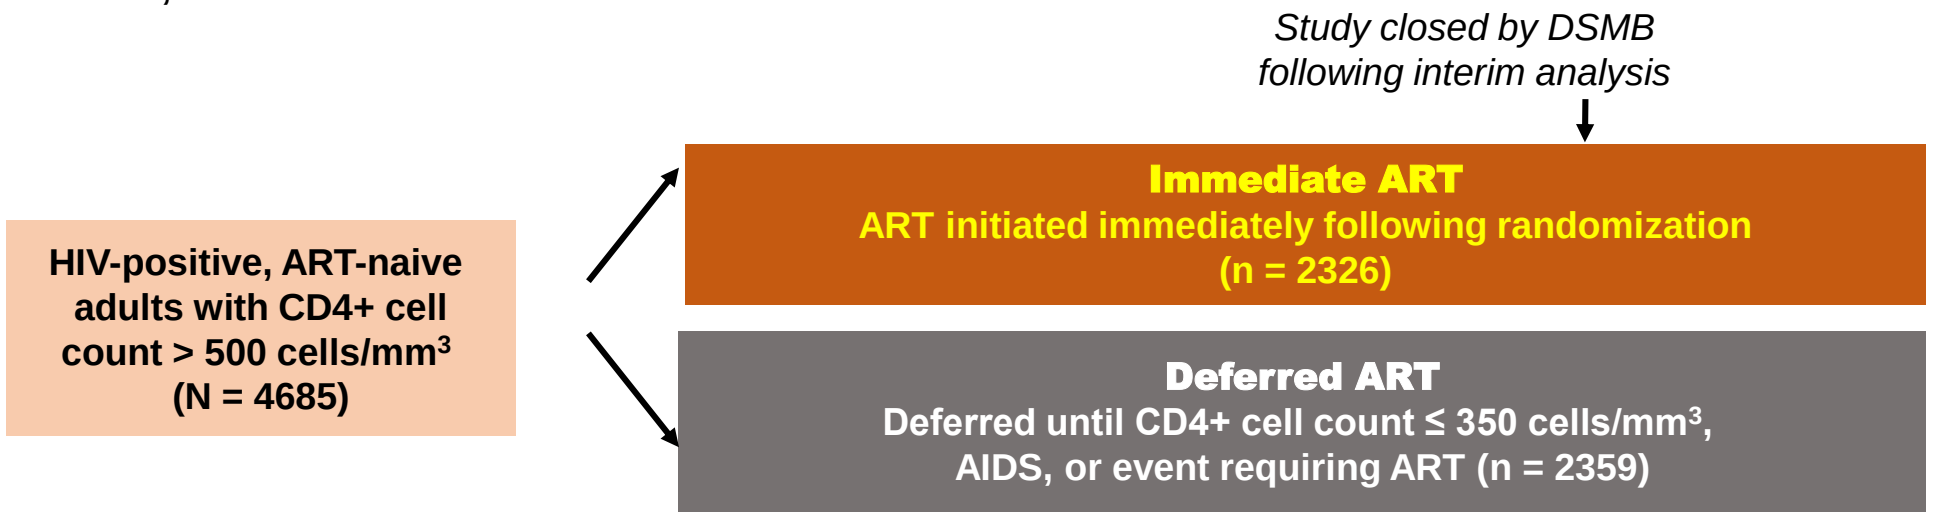
Event, n (Rate per 100 Person-Yrs)	Deferred Arm (n = 228)	Immediate Arm (n = 249)	HR (DC/VS)	95% CI	*P* Value
OD/death	15 (4.8)	5 (1.3)	3.5	1.3-9.6	.02
OD only	11 (3.5)	4 (1.1)	3.3	1.0-10.3	.04
Serious non-AIDS events	12 (3.9)	2 (0.5)	7.0	1.6-31.4	.01
Composite*	21 (7.0)	6 (1.6)	4.2	1.7-10.4	.002

*Fatal and nonfatal OD plus serious non-AIDS events.

Emery S, et al. J Infect Dis. 2008;197:1133-1144.

START: Immediate vs Deferred Therapy for Asymptomatic, ART-Naive Patients

- **International, randomized trial**

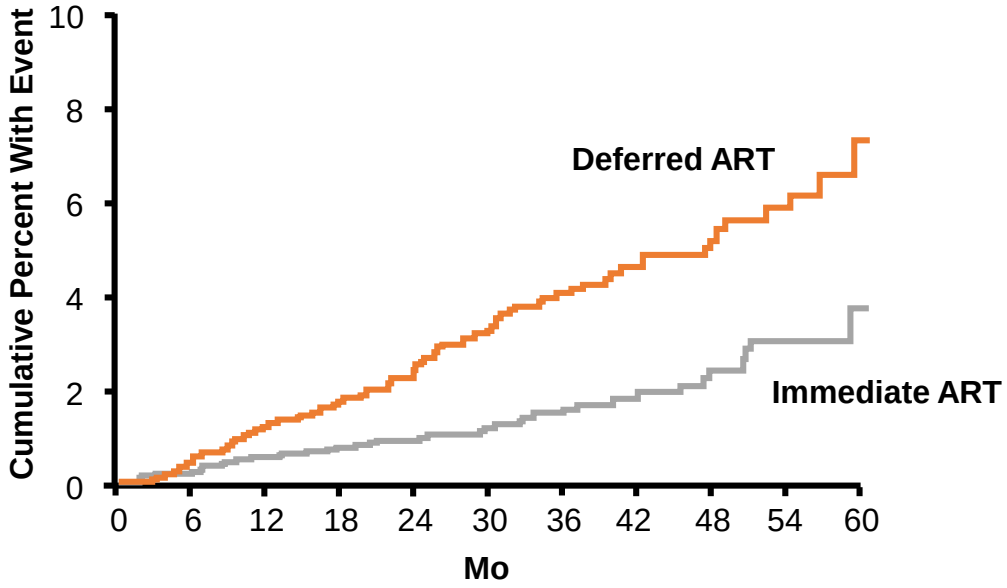


- **Composite primary endpoint: any serious AIDS-related (AIDS-related death or AIDS-defining event) or non-AIDS–related event (non-AIDS–related death, CVD, end-stage renal disease, decompensated liver disease, non-AIDS–defining cancer)**
- **Mean follow-up: 3 yrs; median baseline CD4+ cell count: 651 cells/mm^3; median baseline HIV-1 RNA: 12,759 copies/mL**
- **Median CD4+ cell count at initiation of ART for deferred group: 408 cells/mm^3**

INSIGHT START Study Group. *N Engl J Med*. 2015;373:795-807.
Lundgren J, et al. IAS 2015. Abstract MOSY0302.

START: 57% Reduced Risk of Serious Events or Death With Immediate ART

- **4.1% vs 1.8% in deferred vs immediate arms experienced serious AIDS or non-AIDS–related event or death (HR: 0.43; 95% CI: 0.30-0.62; *P* < .001)**



INSIGHT START Group. N Engl J Med. 2015;373:795-807.
Lundgren J, et al. IAS 2015. Abstract MOSY0302. Reproduced with permission.

START: Primary Endpoint Components With Immediate vs Deferred ART

Endpoint	Immediate ART (n = 2326)		Deferred ART (n = 2359)		HR (95% CI)	*P* Value
	N	Rate/100 PY	N	Rate/100 PY		
Serious AIDS-related event	14	0.20	50	0.72	0.28 (0.15-0.50)	< .001
Serious non-AIDS–related event	29	0.42	47	0.67	0.61 (0.38-0.97)	.04
All-cause death	12	0.17	21	0.30	0.58 (0.28-1.17)	.13
Tuberculosis	6	0.09	20	0.28	0.29 (0.12-0.73)	.008
Kaposi's sarcoma	1	0.01	11	0.16	0.09 (0.01-0.71)	.02
Malignant lymphoma	3	0.04	10	0.14	0.30 (0.08-1.10)	.07
Non-AIDS–defining cancer	9	0.13	18	0.26	0.50 (0.22-1.11)	.09
CVD	12	0.17	14	0.20	0.84 (0.39-1.81)	.65

THE SIMIAN MODEL IN SIV DISEASE

Bissel SJ, Kofler J, Nyaundi J, et al. Cerebrospinal fluid biomarkers of simian immunodeficiency virus encephalitis.
J Neuroimmune Pharmacol 2016 June; 11(2): 332-347. doi:10,1007/s11481-016-9666-9

N = 19 *Macaca nemestrina* inoculated with **SIVDeltaB670 virus** and studied from **Jan 2004-April 2009**
Animals were euthanized upon development of clinical 'AIDS' – CSF and brain removed at death

SIV encephalitis (SIVE) = presence of SIV in brain tissue + microgial nodules + multinucleated giant cells + profuse perivascular infiltrate of mononuclear cells (definition of SIV encephalitis)

Macaques that developed (viral) encephalitis had evidence of chronic CNS immune activation throughout their post-infection life

- ❑ **at acute infection**
- ❑ **during asymptomatic infection**
- ❑ **and at end-stage infection**

YKL40 = a protein (glycosyl hydrolase family 18) expressed by synovial cells, neutrophils and macrophages in blood, and astrocytes in CNS tissue and CSF: a protein that assists SIV and HIV in its binding to extracellular matrix cells in the CNS.

Bissel SJ, Kofler J, Nyaundi J, et al. Cerebrospinal fluid biomarkers of simian immunodeficiency virus encephalitis. J Neuroimmune Pharmacol 2016 June; 11(2): 332-347. doi:10,1007/s11481-016-9666-9

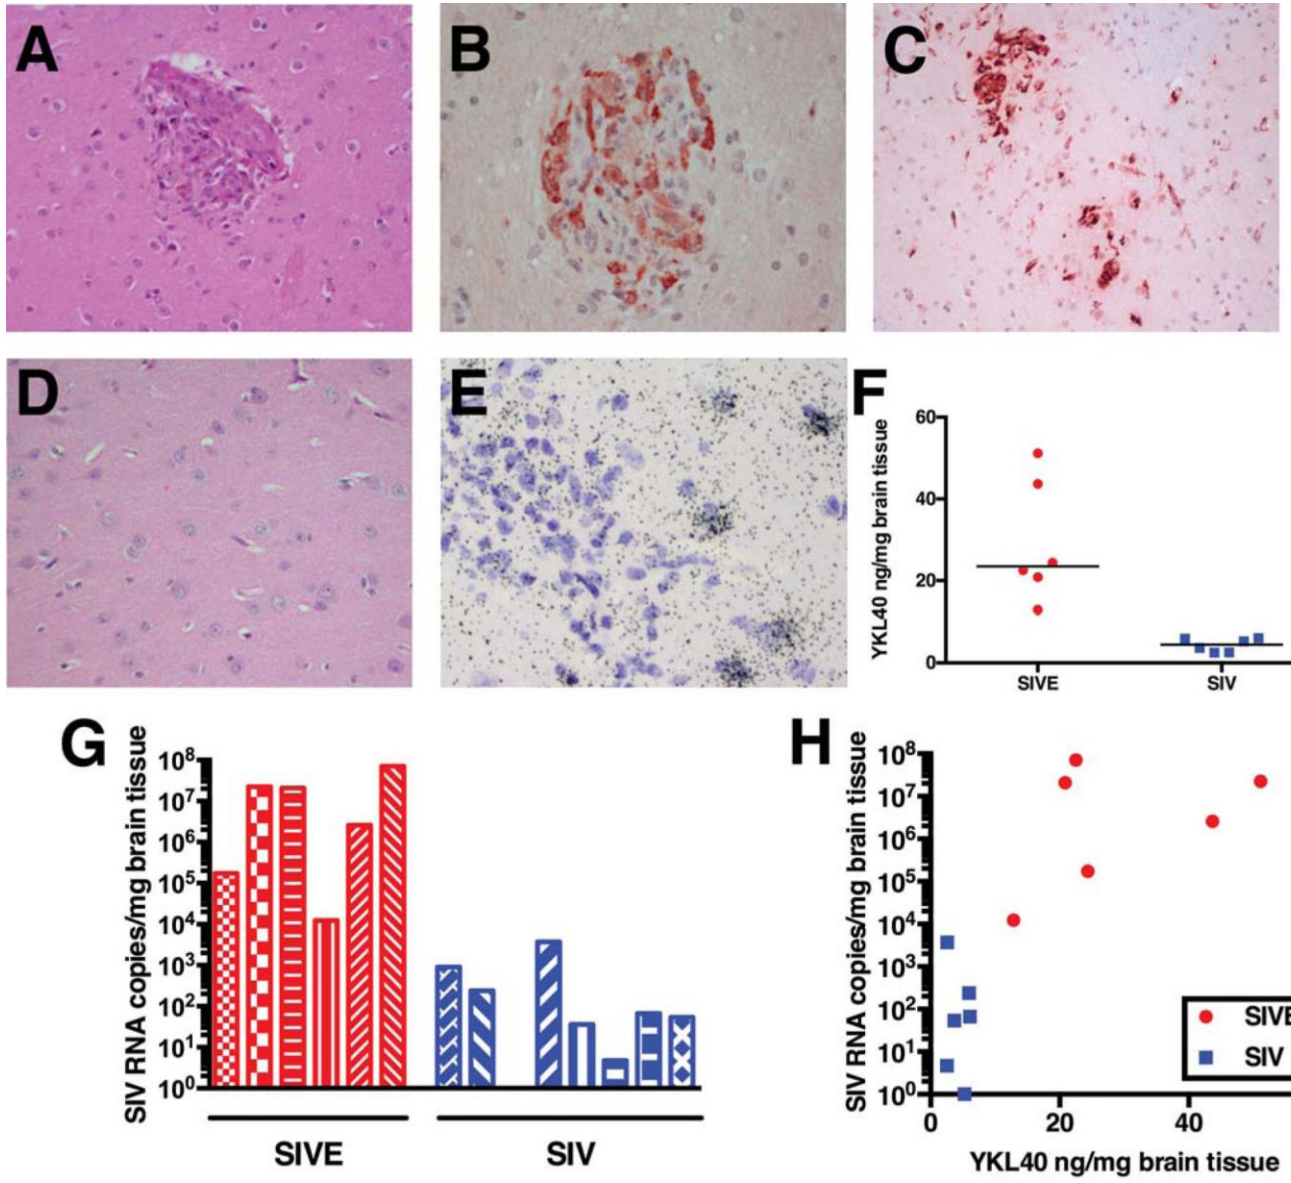

Fig. 1. Macaques with SIV encephalitis show SIV-infected microglial nodules and increased SIV viral load and YKL40 expression in frontal cortical tissue

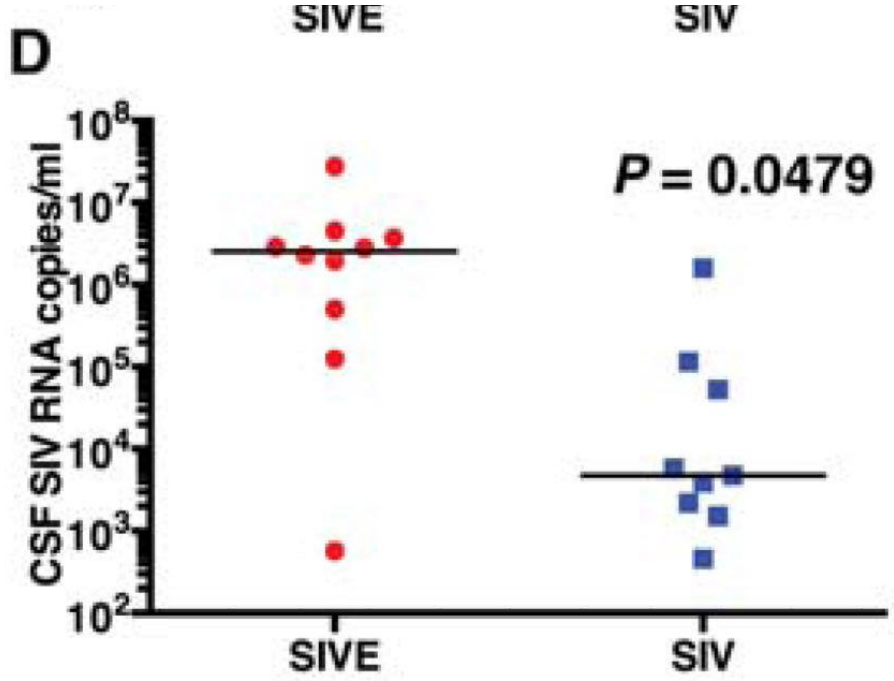

Bissel SJ, Kofler J, Nyaundi J, et al. Cerebrospinal fluid biomarkers of simian immunodeficiency virus encephalitis.
J Neuroimmune Pharmacol 2016 June; 11(2): 332-347. doi:10,1007/s11481-016-9666-9

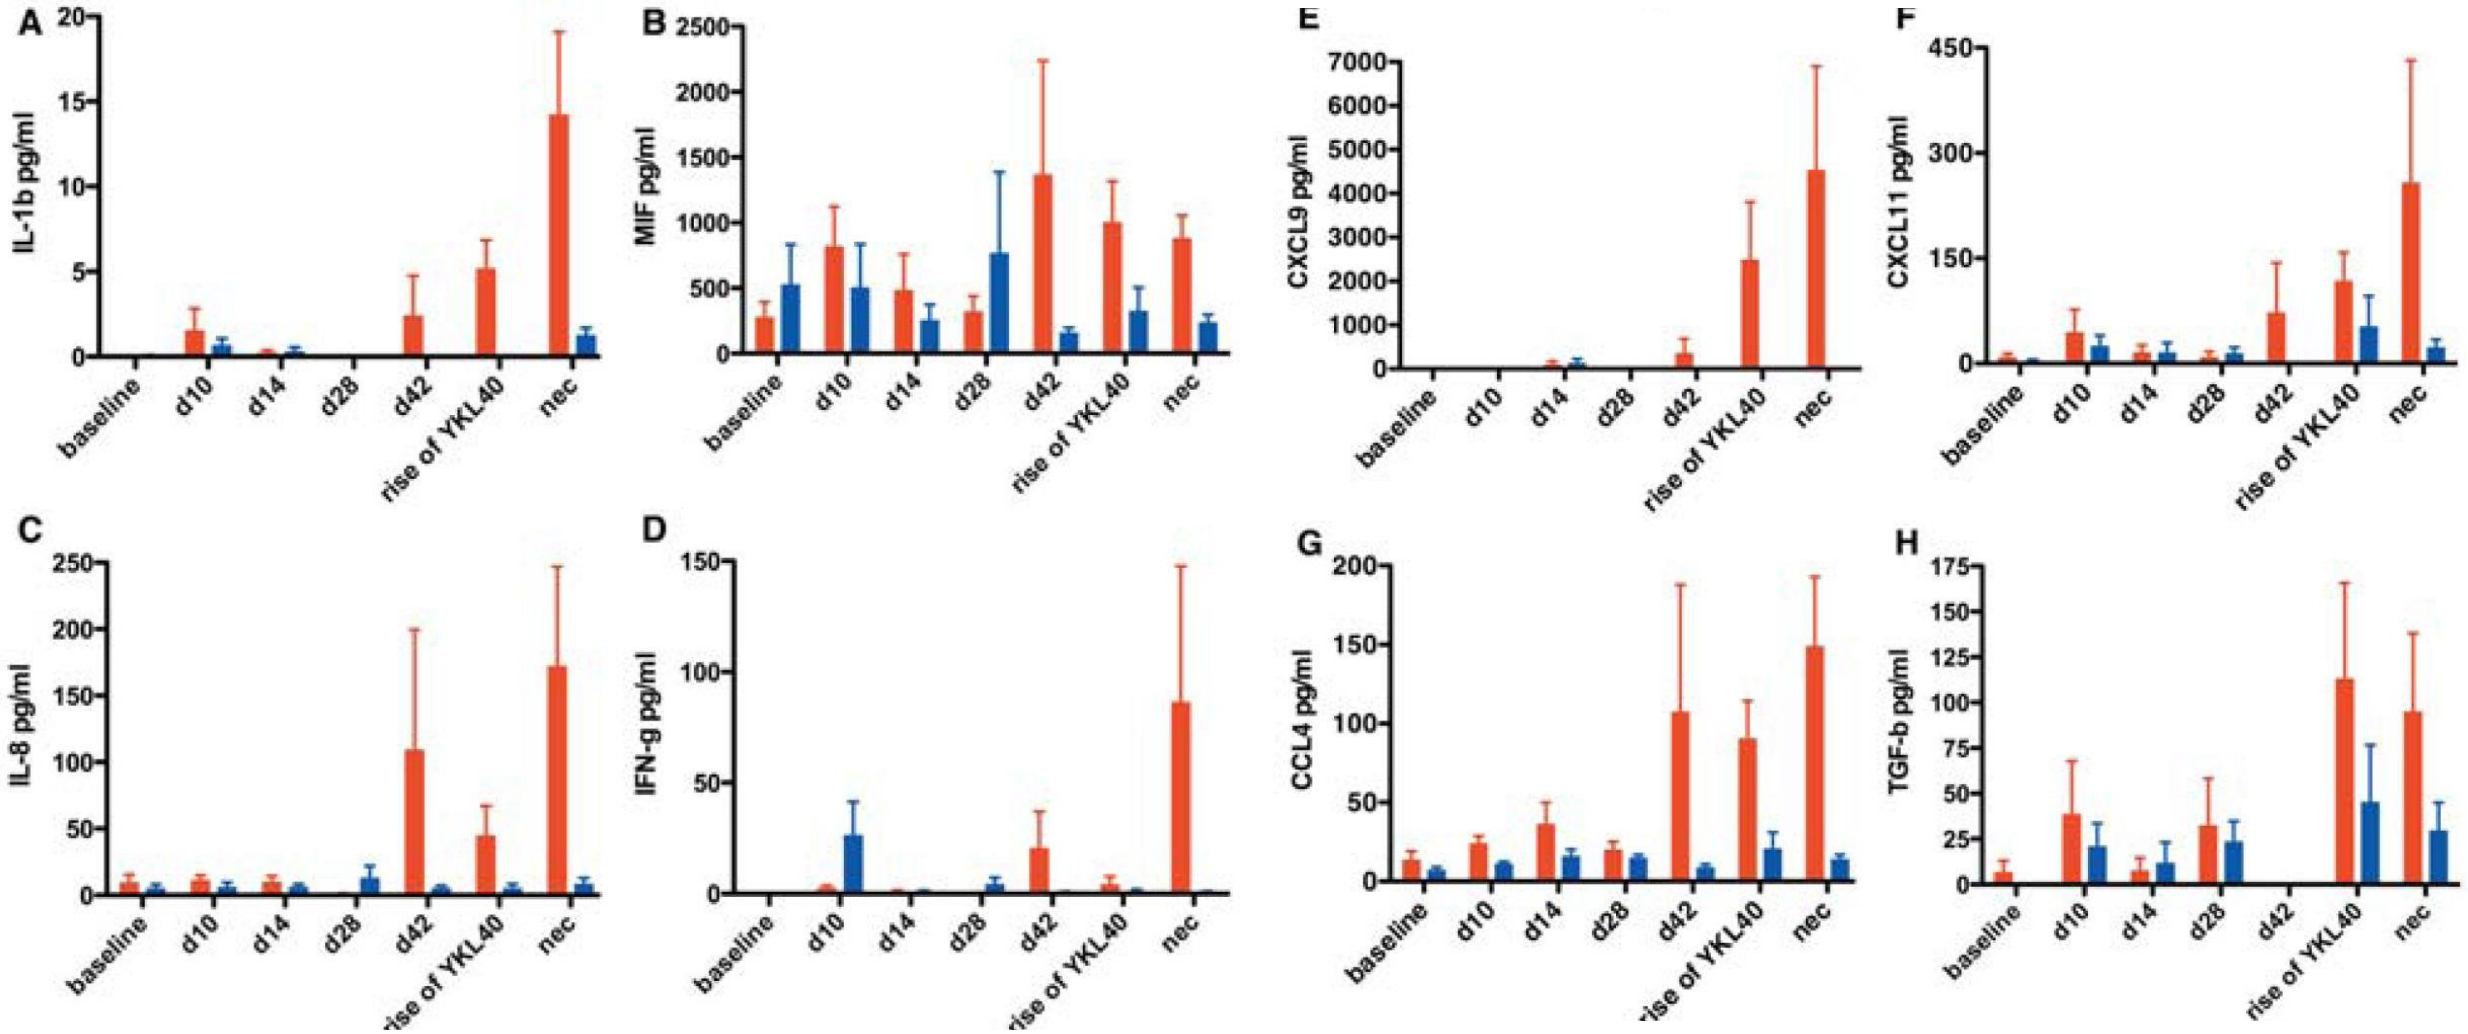

Fig. 6. The majority of elevated neuroimmune markers became elevated as encephalitis developed and were associated with macrophage recruitment and activation.

Multiplex quantitation of 31 cytokines present in the CSF was performed on samples from **baseline (d0)**, **acute infection (d10 and d14)**, **asymptomatic infection (d28 and d42)**, **development of encephalitis (rise of YKL40), and at necropsy (nec).** IL-1β **(a)**, MIF **(b)**, IL-8 **(c)**, IFN-γ **(d)**, CXCL9 **(e)**, CXCL11 **(f)**, CCL4 **(g)**, TGF-β **(h)** were elevated when encephalitis (red) developed or shortly before. SIV-infected non-encephalitic macaques. Bissel SJ., et al. 2016

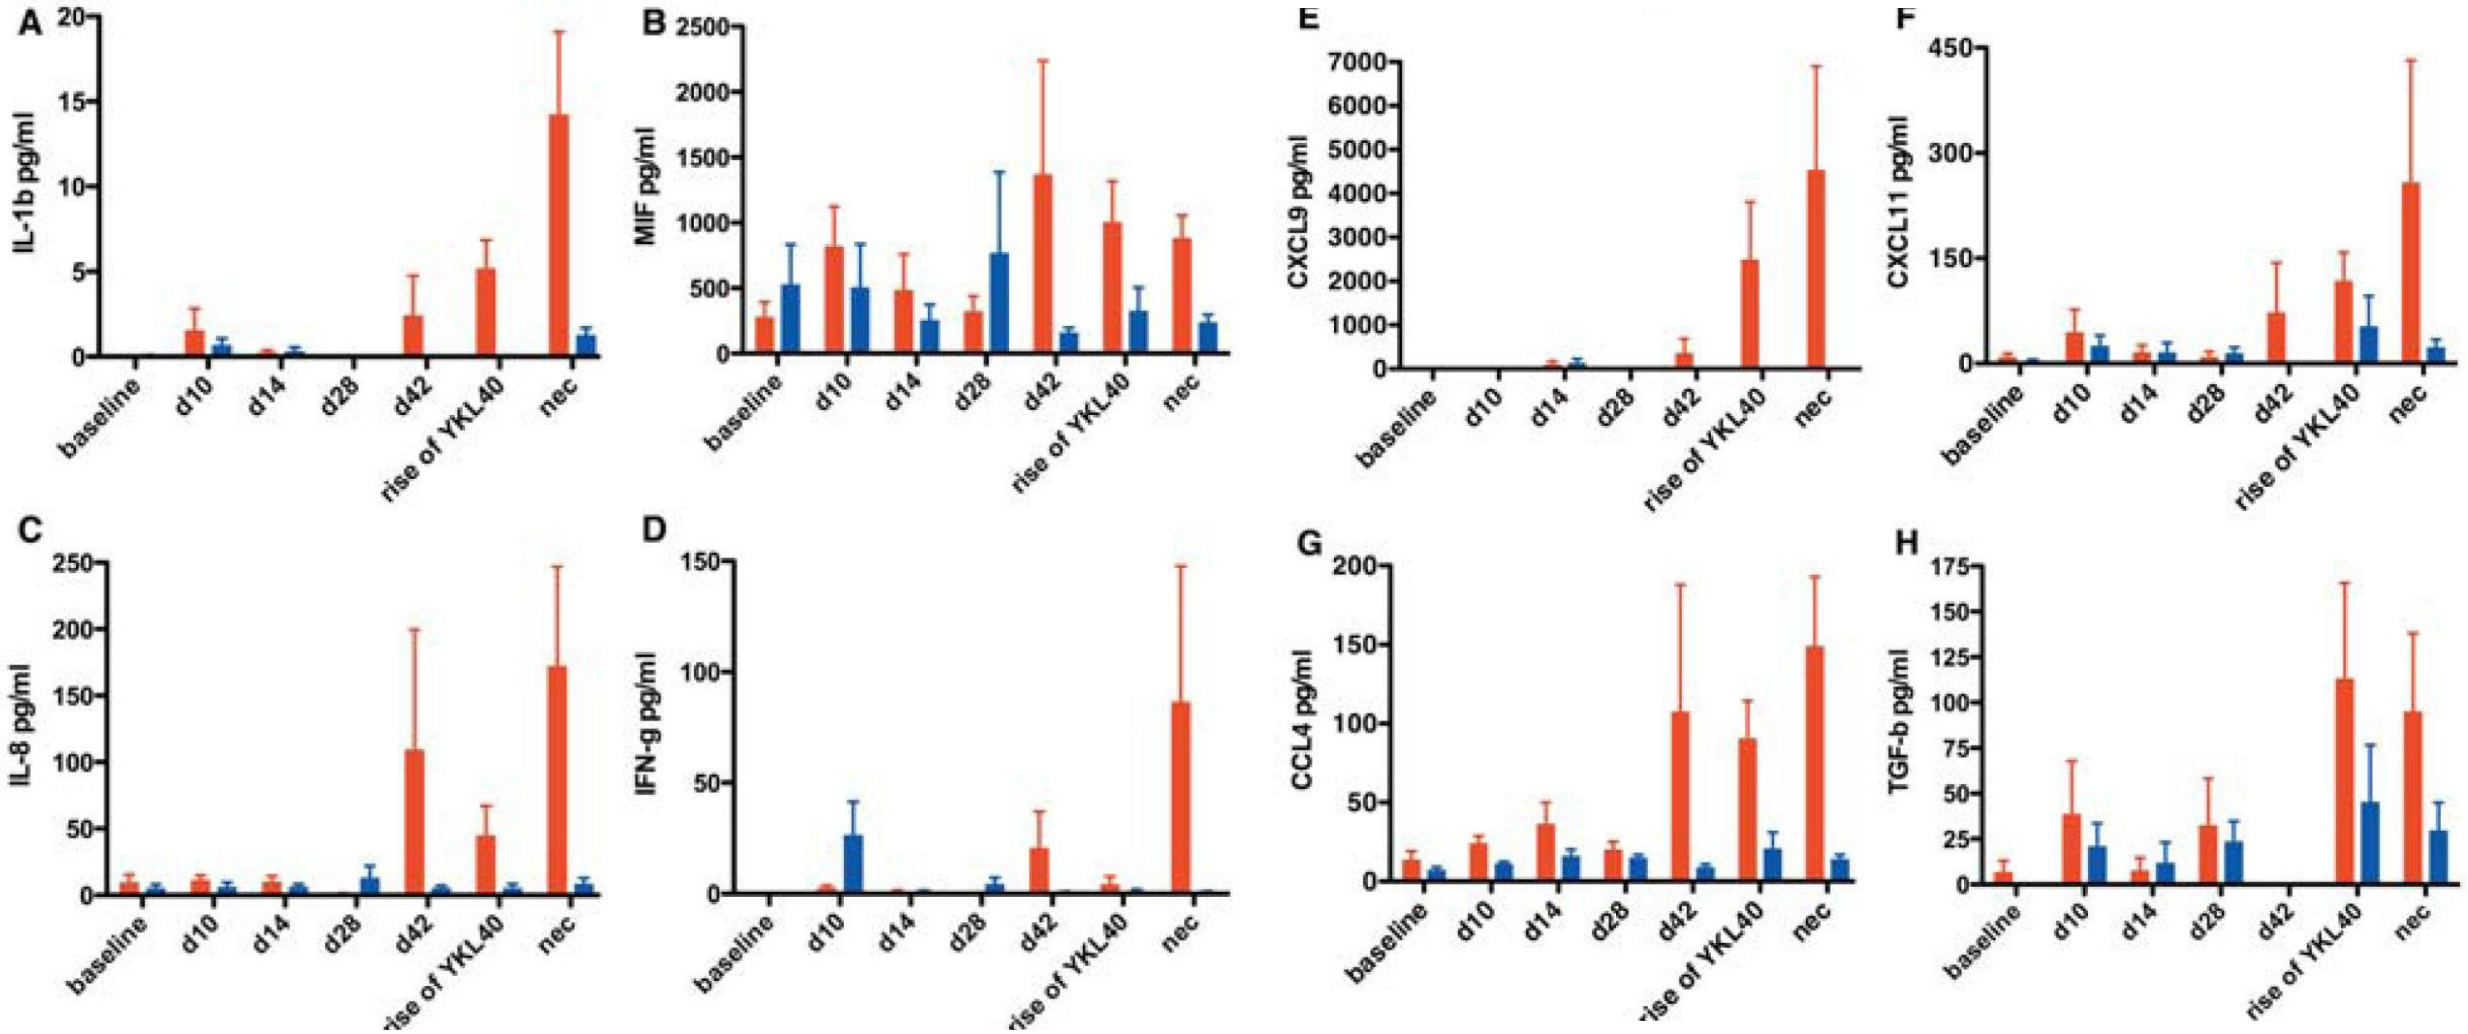

Fig. 6. The majority of elevated neuroimmune markers became elevated as encephalitis developed and were associated with macrophage recruitment and activation.

NEURO-IRIS?

Patient: 35yr SA Nurse in the USA. MVA – driving at low speed without a seat-belt.
No LOC. Behaving strangely. Disorientated.

Admitted: No evidence of trauma. Apart from disorientation, exam was normal.
CT brain without contrast = prominent areas of low attenuation in
both hemispheres, no bleeds, no contusion, no infarct.

PMH: Tested HIV+ve 4 years earlier following a PAP smear and high grade cervical dysplasia.
Started on ART: TDF + FTC +LPV/r
Baseline CD4 = 211 c/mm³ VL = 476,000 cp/ml

Daily H/A started 2yr before admission. LP = CSF pleocytosis. Tx IV acyclovir.
H/A improved over next 2 months. But recurred after 6 months. Accompanied by
general malaise, photophobia, N & V, gait instability.
MRI Brain with gadolinium = diffuse lepomeningeal enhancement, extensive asymmetric
hyperintensity on T2-weighted and fluid-attenuated inversion recovery (FLAIR) images
of the subcortical, basal ganglia, dorsal pons.

Costello DJ, Gonzalez RG, Frosch MP. Case 18-2011: A 35-Year-Old HIV Positive Woman
with Headache and Altered Mental Status. N Engl J Med 2011 June 16: 364: 2342-52

CSF Variable	Reference	Ist admissn 16m before	12m before Admissn.	5m before admission	Current admissn.
White cells/mm³ Tube 1	0-5	76	28	23	33
Tube 2	0-5	58		11	28
Diff, on WBCs: polys (%)	0	0	0	1	2
Lymphs (%)	0	93	90	94	97
Protein (mg/dl)	5-55	85	92	79	102
Glucose (mg/dl)	50-75	57	61	55	64
Lactate (mmol/l)	0.5-2.2			1,5	
IgG (mg/dl)	0-8.0		61.7	34.8	
Albumin (mg/dl)	11.0-50.9		21.6	31.9	
Electrophoresis	No bands		2 bands	3 bands	
HIV viral load (cp/ml)	<400	1220	471	<400	<400
HSV-1 & HSV-2 DNA	Negative	Negative			Negative
EBV DNA (cp/ml)	<200		200		<200
IgG to EBV (IFA)	1:64				1:256
IgM to EBV (IFA)	<1.1				<1.1
JC virus PCR (cp/ml)	<500				<500

NB. CSF from the patient reveals a persistent abnormality i.e. raised white cells and protein (meningitis) for which the usual viral pathogens test 'negative'.

A meningitis that lasts for 2 years without killing the patient!!

…or a chronic meningoencephalitis caused by….?

Costello DJ, Gonzalez RG, Frosch MP. Case 18-2011: A 35-Year-Old HIV Positive Woman with Headache and Altered Mental Status. *N Engl J Med* 2011 June 16: 364: 2342-52

Table 2. Results of Hematologic and Serum Chemical Studies.*

Variable	Reference Range, Adults†	12 Mo before Admission, in Neurology Clinic	2 Mo before Admission	On Admission
CD4 T-lymphocyte count (per mm^3)	348–1456	581	665	397
CD8 T-lymphocyte count (per mm^3)	148–1173	533	582	546
Aspartate aminotransferase (U/liter)	9–32	23	24	35
Alanine aminotransferase (U/liter)	7–30	27	33	38
Antinuclear antibody	Negative at 1:40 and 1:160 dilutions	Positive at 1:640 dilution, speckled pattern		
IgG antibodies to EBV viral capsid antigen	<1:10, negative	>1:10,240		
EBV DNA (copies/ml)	<200, negative	2100		<200
Human immunodeficiency virus RNA (PCR) (copies/ml)	<50	<50	<50	228

* EBV denotes Epstein–Barr virus, and PCR polymerase chain reaction.
† Reference values are affected by many variables, including the patient population and the laboratory methods used. The ranges used at Massachusetts General Hospital are for adults who are not pregnant and do not have medical conditions that could affect the results. They may therefore not be appropriate for all patients.

Comment:

CD4:CD8 ratio = <1 on admission.

Previously CD4:CD8 ratio>1

Costello DJ, Gonzalez RG, Frosch MP. Case 18-2011: A 35-Year-Old HIV Positive Woman with Headache and Altered Mental Status. N Engl J Med 2011 June 16: 364: 2342-52

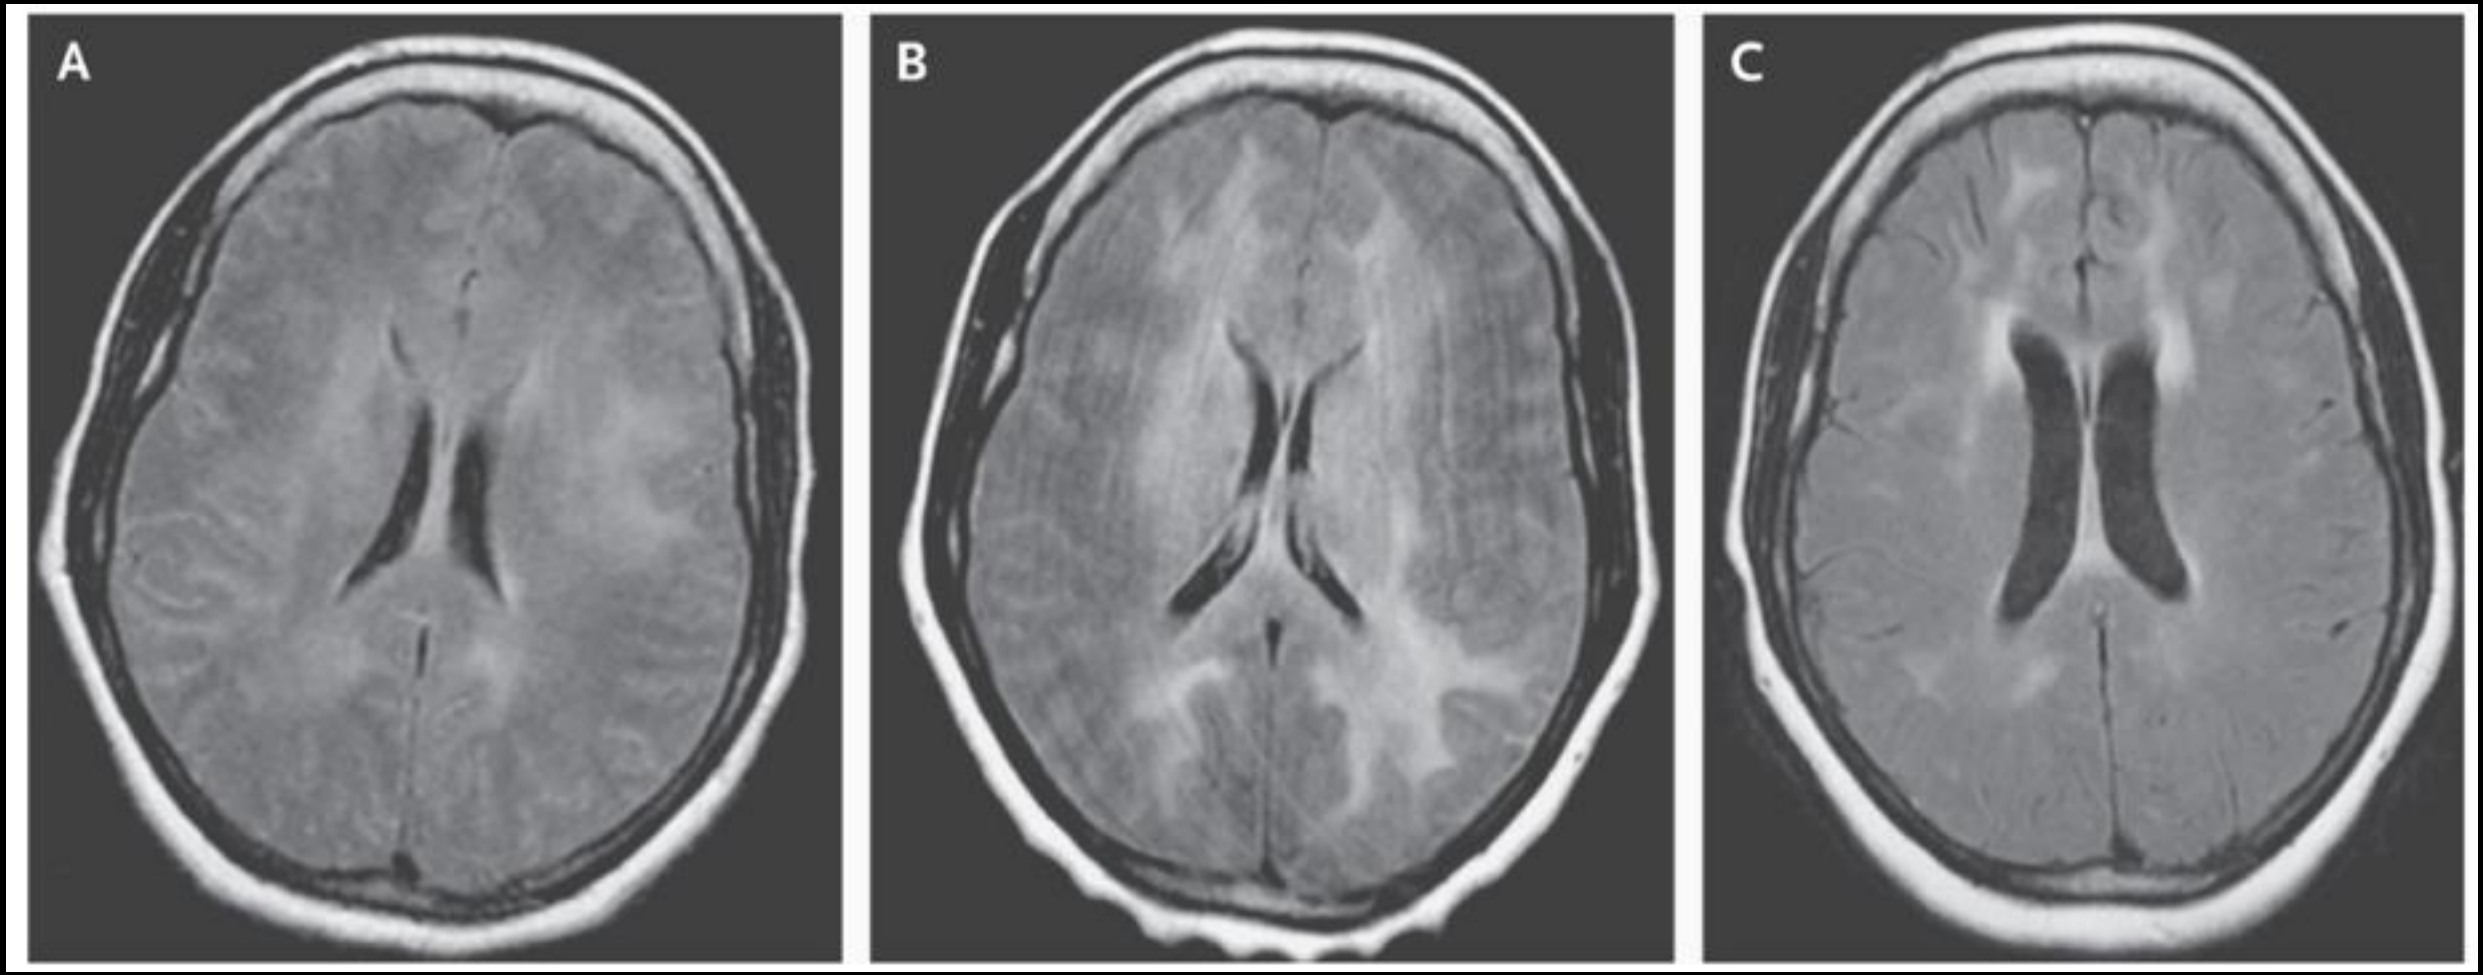

Figure. Fluid-attenuated inversion recovery (FLAIR) images obtained from the initial MRI of the brain reveal hyperintense signal abnormalities involving the subcortical and deep white matter at the level of the lateral ventricles (Panel A). FLAIR images from the MRI performed two years later, at the time of the current admission, show a significant progression of the while-matter signal abnormalities (Panel B). FLAIR images obtained 1 year after the initiation of glucocorticoid treatment reveal multifocal regions of hyperintense signal abnormality (Panel C). However, the abnormalities are far less extensive than those seen in the earlier images.

Costello DJ, Gonzalez RG, Frosch MP. Case 18-2011: A 35-Year-Old HIV Positive Woman with Headache and Altered Mental Status. N Engl J Med 2011 June 16: 364: 2342-52

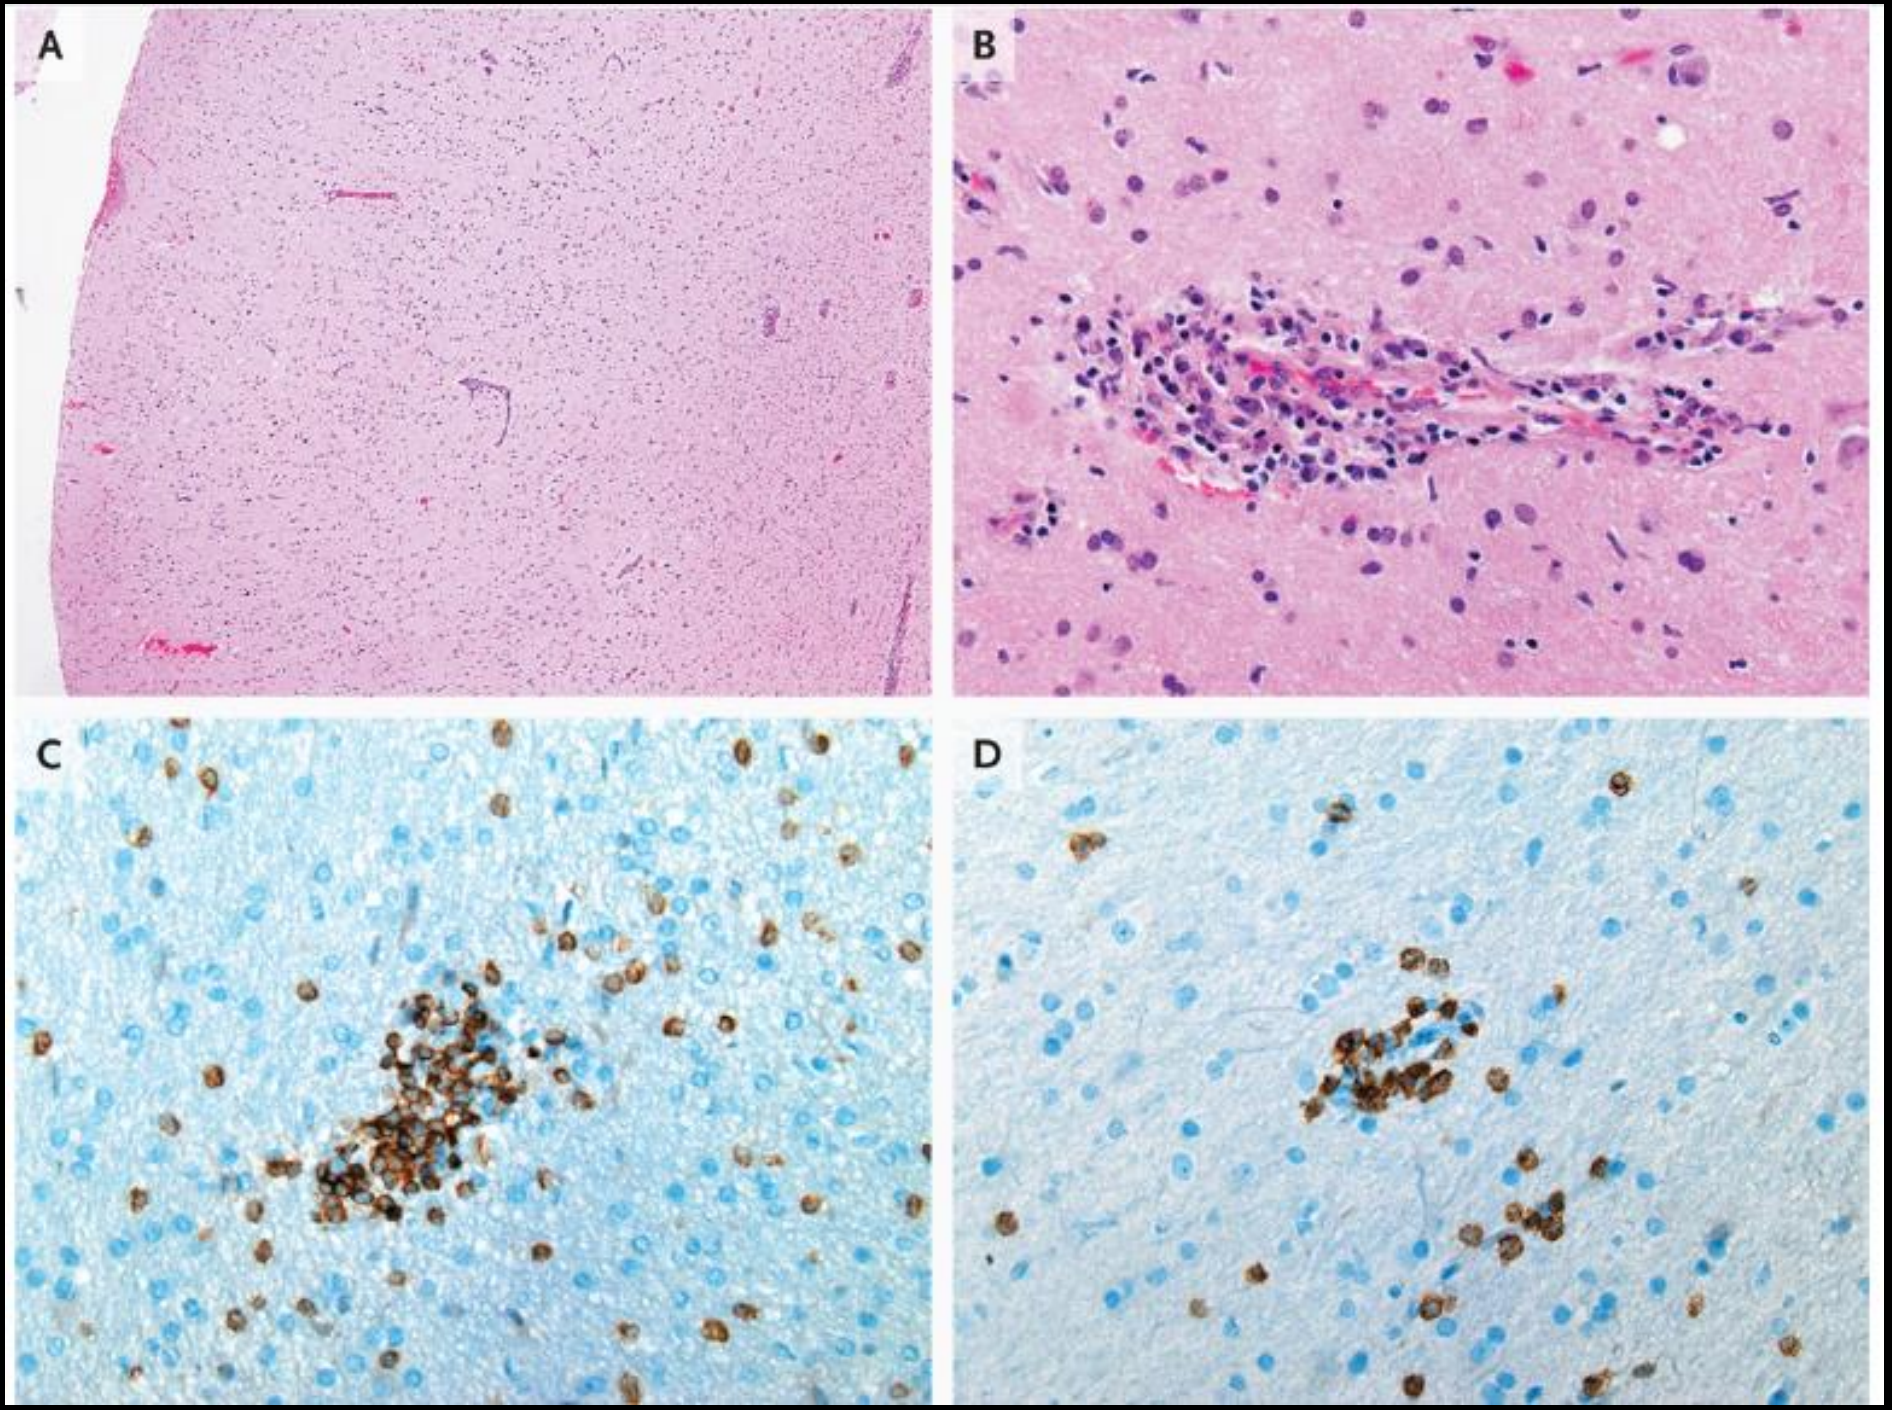

Figure. Brain Biopsy.

A. Biopsy of the right frontal lobe was performed. The specimen from the cerebral cortex shows normal architecture and multifocal perivascular infiltrates but no notable leptomeningeal cellularity (Panel A).

The perivascular infiltrate is composed of small, benign inflammatory cells, without evidence of vascular-wall injury (Panel B).

Immuno-histochemical staining for CD3 shows that the infiltrate consists of T cells, with extension of the lymphocytic infiltrate into the parenchyma (Panel C).
And that the majority of T cells express CD8 (Panel D)

Costello DJ, Gonzalez RG, Frosch MP. Case 18-2011: A 35-Year-Old HIV Positive Woman with Headache and Altered Mental Status. N Engl J Med 2011 June 16: 364: 2342-52

NEURO-IRIS?

Assessment: "Diffuse abnormalities on imaging studies, similar to those seen in this patient have been described in patients with neuro-IRIS and no evidence of coinfection. Similarly lymphocytic pleocytosis has been reported. In order to make a definitive diagnosis of neuro-IRIS and definitively rule out other causes, an open brain biopsy of the right frontal lobe and meninges was performed on the sixth hospital day."

"Since her symptoms had waxed and waned in the past, since the biopsy suggested neuro-IRIS, and since opportunistic infection had been ruled out, prednisone 60mg per day was initiated… The ART was not changed. The steroid was tapered during the next year to 5 mg per day and administration of steroid was discontinued after 2.5 years. She has been evaluated clinically at regular intervals and with repeated MRI scans. Most of her white-matter abnormalities have resolved and the patient has returned to full time work.
